1.0 INTRODUCTION

The Trading Explorer Desktop centralizes the management of trades and their associated business data. It provides all of the functionality of the existing Trading Manager, incorporating a single window to view and manage trade data. The Trading Explorer Desktop allows users to:

- Create, edit, and compare trades
- View deals, events, instruments, and settlement instructions
- Run simulations, scripts, and tasks

In addition to the functionality provided by the standard Trading Explorer Desktop, there is also the flexibility to create custom Trading Explorer views that meet the needs of end users.

This document provides an overview on the use and functionality of the Trading Explorer Desktop, with a focus on creating, modifying, and viewing trades. It is written for users with a basic understanding of the OpenLink system and the functionality of the Trading Manager. The information in this document is applicable to V10.0r2 and above.

1.1 Additional Resources

For additional information about the Trading Explorer Desktop, refer to the items listed in the table below:

Reference	Description
<i>Trading_Explorer_Desktop_Quick_Start_Guide.pdf</i>	This document describes the Trading Explorer Desktop basic components and navigation. It also provides guidelines for creating custom views.
<i>Trading Explorer Desktop Section</i>	This compilation of information in the <i>OpenLink User Guide</i> (i.e., online help system) describes the Trading Explorer Desktop components in detail: panels, menus, buttons and fields.

2.0 TRADING EXPLORER DESKTOP BASICS

The Trading Explorer Desktop, launched as an OpenLink Service, is used to create and manage an organization's trades and processes associated tasks from the convenience of a single desktop. This section describes how to start the Trading Explorer Desktop, as well as the basic screen components of the standard Trading Explorer Desktop.

2.1 Starting Trading Explorer Desktop

To start the Trading Explorer Desktop:

Click the **Trading** button on the OpenLink Central control panel. The standard Trading Explorer Desktop appears.

Alternatively, the Trading Explorer can be launched by clicking the **Desktop** button on the OpenLink Central control panel and selecting *Trading Explorer Desktop* from the pick list that appears.

The Trading Explorer Desktop can also be launched from the Launch Available Services window, accessible through the menu bar of the OpenLink Central control panel.

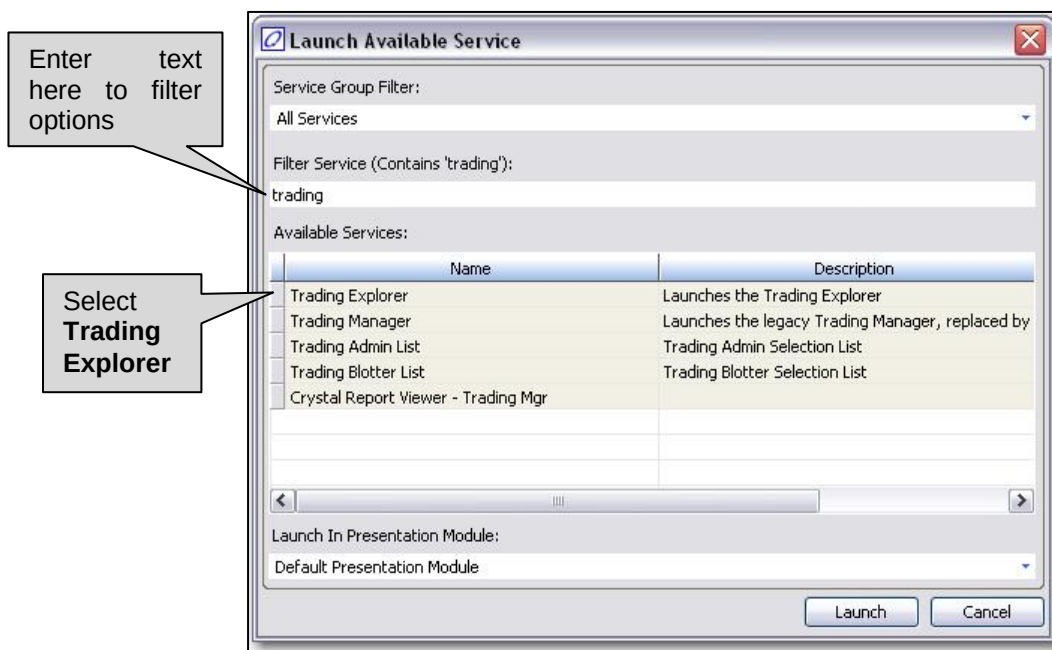

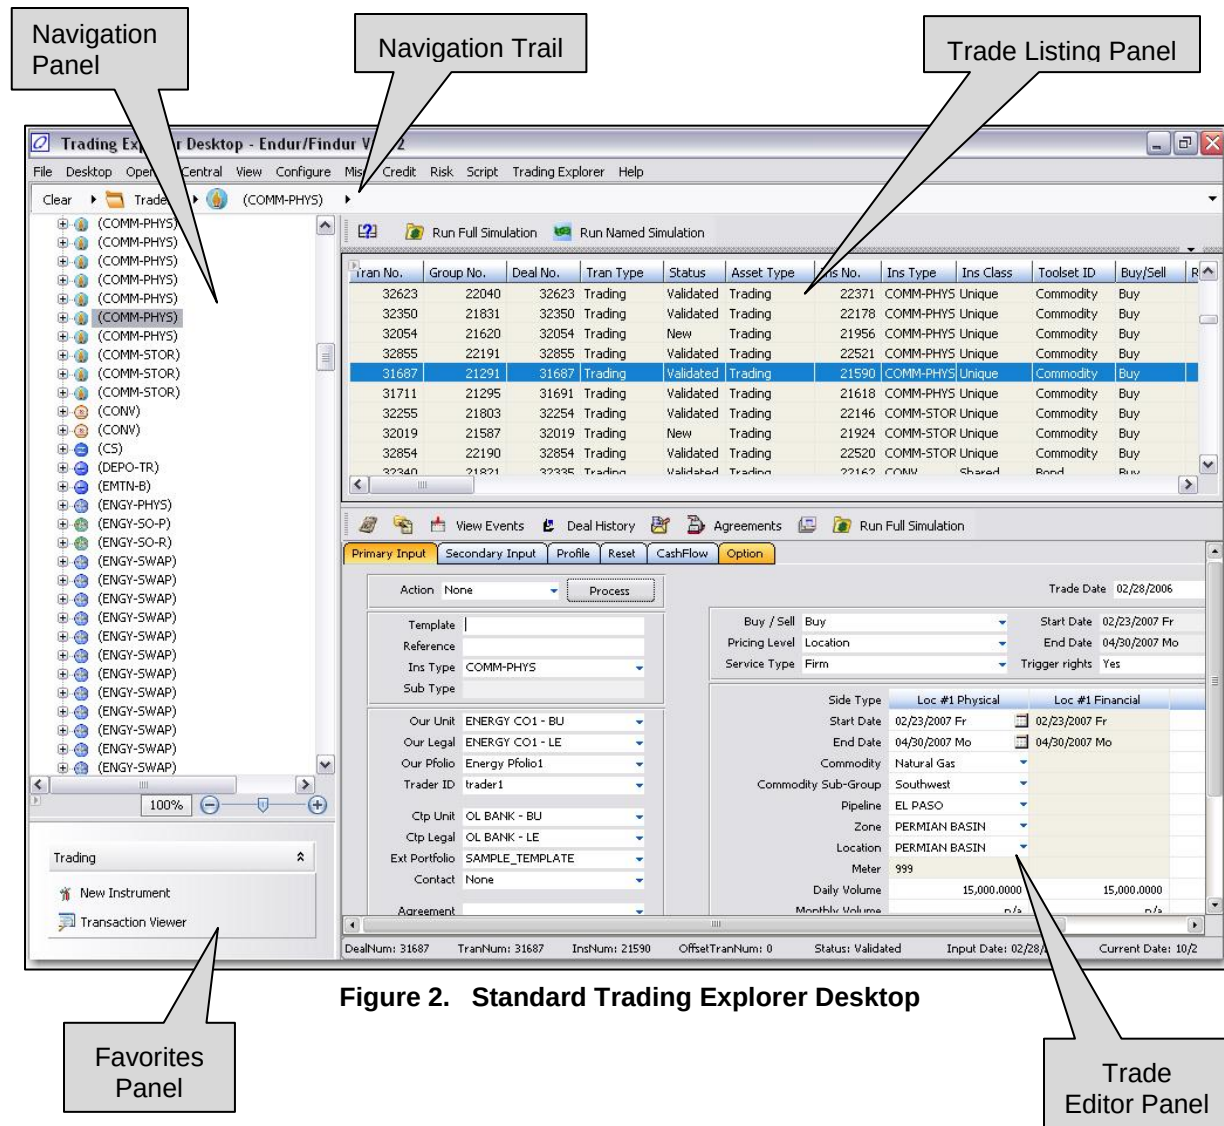

Figure 1. Launch Available Services Window

2.2 Screen Layout

When the Trading Explorer Desktop first opens, the window is essentially blank. Once a trade is selected in the Navigation Panel, the remaining panels will populate with trade listings and data. The screen of the standard Trading Explorer Desktop is divided into five main components, as shown in Figure 2:

The table below describes the functionality of each screen component:

Desktop Component	Description
Navigation Panel	Provides a hierarchical view of an organization's trades and their inter-dependent business objects.
Trade Listing Panel	Displays a detailed listing of trades for a particular toolset in a GUI grid view.
Trade Editor Panel	Provides an editable area to view and process trades selected in the Trade Listing Panel.
Favorites Panel	Provides direct access to frequently used screens.
Navigation Trail	Displays the current path taken in the Navigation Panel. A user can quickly navigate to a location by selecting a node within the path.

Each screen component is described in detail in the sections that follow.

2.3 Navigation Panel

The Navigation Panel displays details of an organization's trades. Trades are listed alphabetically according to instrument type. Selecting a trade in the Navigation Panel brings up details about that trade in the Trade Listing Panel and Trade Editor Panel (Figure 3).

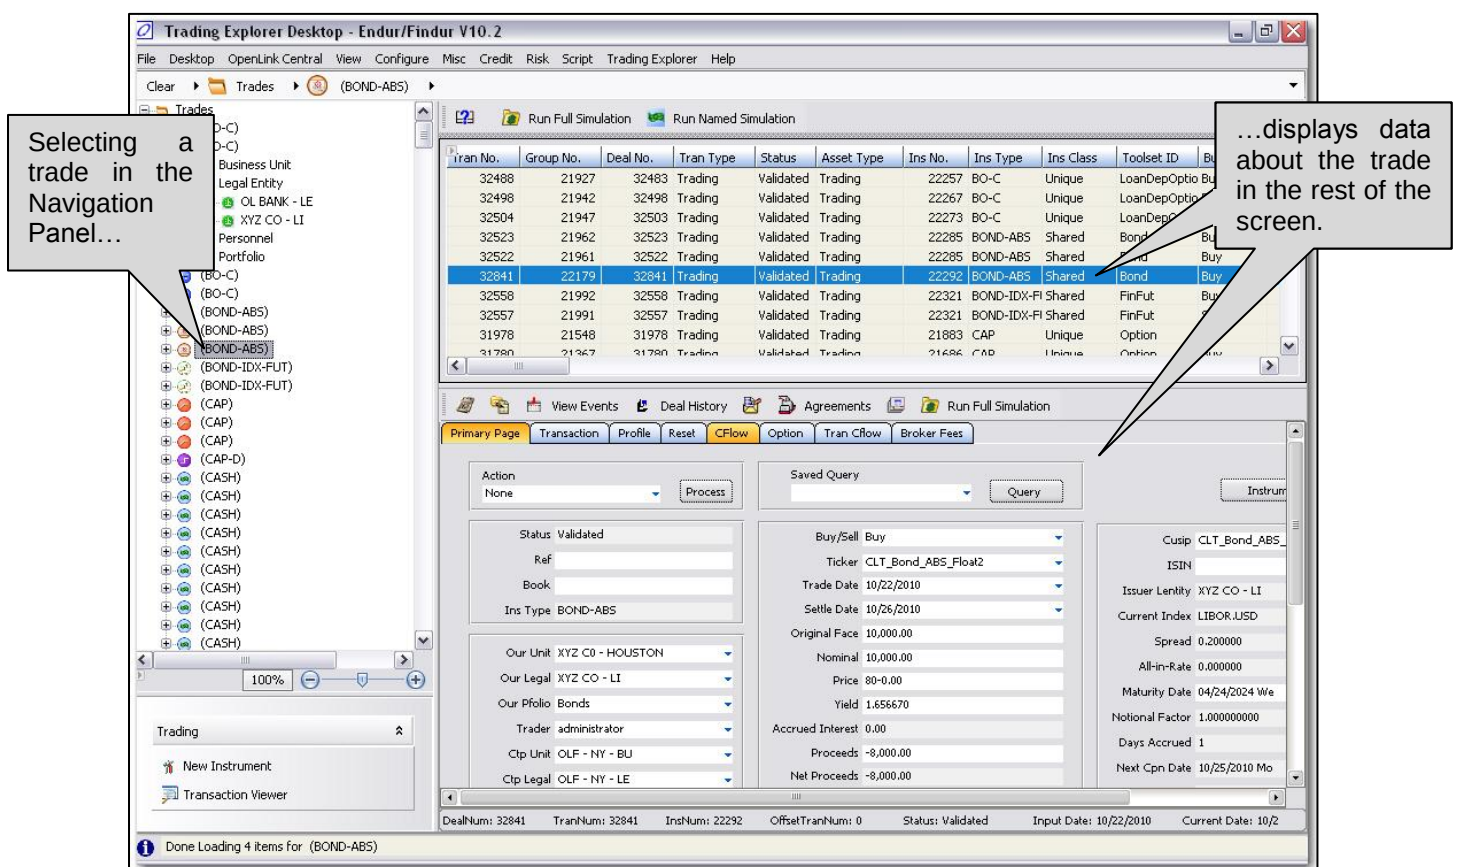

Figure 3. Viewing Trades in the Navigation Panel

Each trade in the Navigation Panel contains sub-groups of associated data. These sub-groups are:

- Business Unit
- Legal Entity
- Personnel
- Portfolio

To view these sub-groups, click the plus (+) symbol next to the trade to expand it. Once the sub-groups appear, they can be further expanded to view specific information. For example, expanding the Business Unit sub-group displays the business units associated with the trade. Those business units can then be expanded to view data such as accounts and settlement instructions.

This “nested” folder structure provides for ease-of-use and quick access to the details of dependent data. By opening a portfolio under a trade, for instance, a user can view all other trades associated with that portfolio.

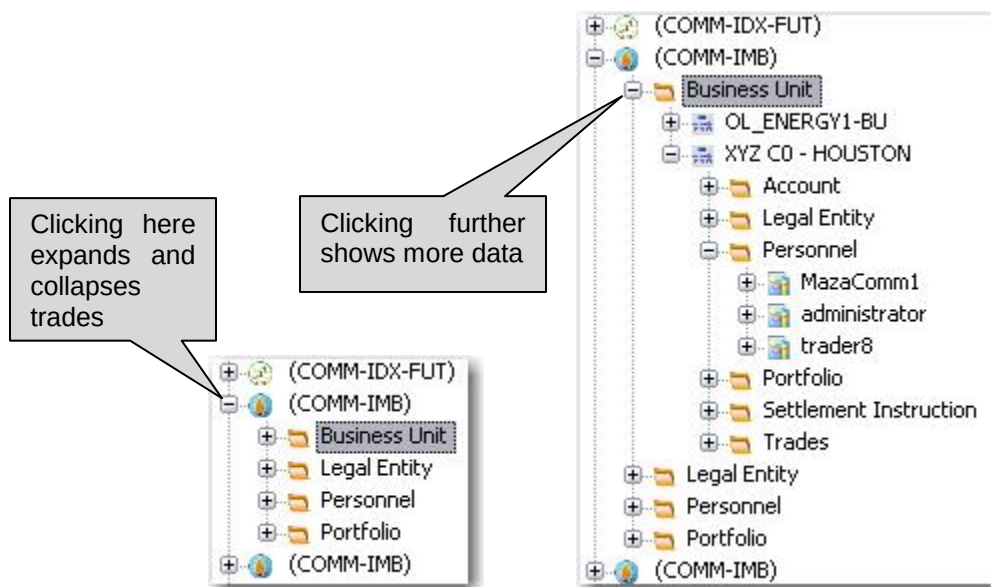

Figure 4. Expanding Folders Display Associated Data

2.3.1 Main Groups

A main group is any primary node in the Navigation Panel. When the Trading Explorer Desktop is first started, only one main group appears in the Navigation Panel—*Trades*. A user can create additional main groups to make it easier to access frequently needed data. For example, a specific trade that is often viewed can be a main group, so that all of its associated data can be quickly accessed and modified (see Figure 5).

Main groups can be folders that contain any type of business object (e.g., Trade, Portfolio, Legal Entity, etc.), or for *individual* data objects (e.g., a single trade, a single portfolio, etc.). Main groups can also be created by copying already existing groups into new primary nodes.

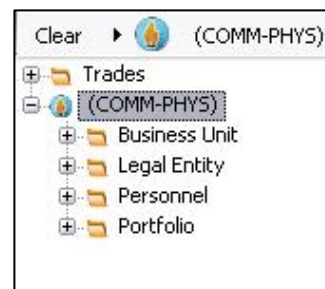

Figure 5. A Trade Configured as a Main Group

2.3.1.1 Creating a Main Group

To create a new main group:

1. From the *Trading Explorer* menu, select **Create Main Group**.

Alternatively, you can right-click in the Navigation Panel and select **Create Main Group** from the *Data Explorer* menu.

A pick list of options appears (Figure 6).

2. Select the type of main group to create. Users can select a folder type or a data type.

Choosing a folder type creates a primary node for the business object in the Navigation Panel.

The new folder will contain all of the data objects currently in the system for the type of business object chosen. For example, if *Personnel Folder* is selected from the pick list, the main group created will be called **Personnel** and will contain all the personnel currently in the system (see Figure 7).

Choosing a data type from the pick list brings up another pick list containing all of the individual items in the system for the type selected. For example, selecting *Legal Entity Data* from the list brings up a list of all the legal entities currently in the system (see Figure 8). Selecting an object in this list creates a primary node for it in the Navigation Panel.

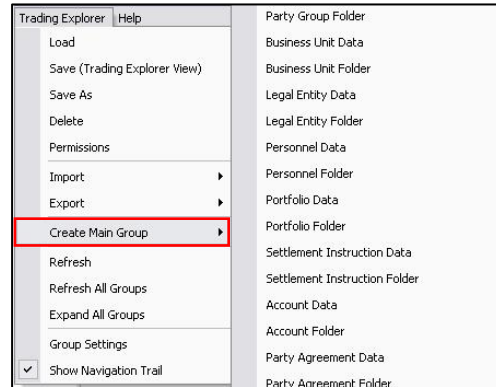

Figure 6. Create Main Group Pick List

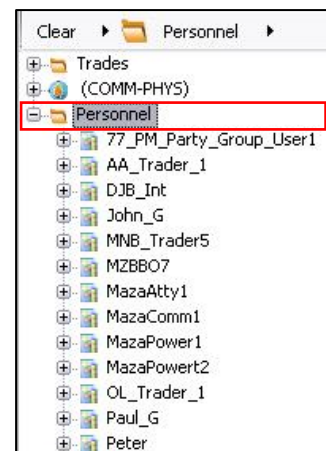

Figure 7. Folder Level Main Group

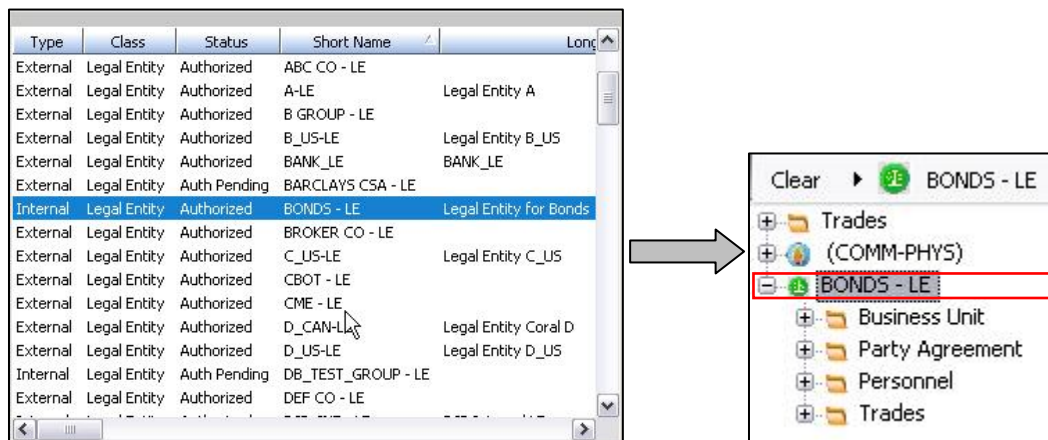

Figure 8. Folder Data Pick List—Legal Entities

2.3.1.2 Copying a Main Group

Copying a main group creates a new primary node on the Navigation Panel from an already existing data object. The new data object can be either a folder or an individual item.

To copy a data object, right-click on the object and select *Copy to Main Group* from the menu. The object will be added to the tree of the Navigation Panel as a primary node.

2.3.1.3 Deleting a Main Group

Any primary node can be removed from the Navigation Panel. To do so, right-click on the node and select **Remove Main Group** from the menu. Click **OK** in the confirmation window to remove the group.

2.3.2 Navigation Panel Configurations

By default, the Navigation Panel displays only one main group when the Trading Explorer Desktop first opens—**Trades**. This configuration is called the *Trade Explorer View*. However, users can add and delete main groups from the Navigation Panel, and then save these configurations for future use. These functions are performed from the *Trading Explorer* menu.

To create a custom configuration:

1. Add and/or delete main groups from the Navigation Panel to create the desired view.

Refer to section 2.3.1 for information about adding and deleting main groups.

In this example, the Trades group has been deleted and two portfolio groups have been added. Such a view might be useful to quickly access all portfolios or particular, often-used portfolios.

Figure 9. Portfolios View

2. From the *Trading Explorer* menu, select **Save As** and enter the applicable data in the Configuration window.

The Configuration window (Figure 10) allows the user to enter a name for the new configuration, as well as directory and permission data.

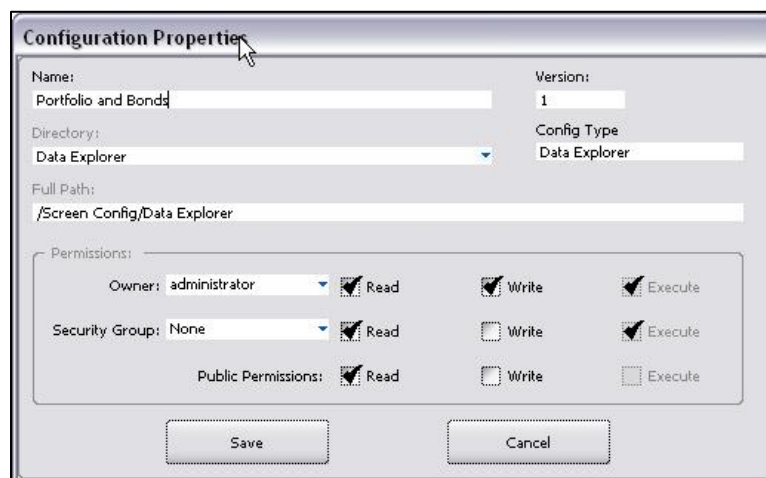

Figure 10. Configuration Window

- Once the configuration data is set, click **Save**.

The configuration will be saved to the database. It can now be loaded again in the future.

To load a configuration:

- From the *Trading Explorer* menu, select **Load**.

A pick list of available desktop configurations appears (Figure 11).

Figure 11. Available Configurations

The *Trading Explorer View* is the standard view for the desktop. The *Reference Data* view contains the standard OpenLink system groups for the Trading Explorer Desktop. Both these views are OpenLink “owned” configurations and cannot be modified or deleted. The *None* configuration is also standard, and includes every type of main group in the system.

- Select the desired configuration from the pick list.

The Navigation Panel will change to display the main groups for the chosen configuration.

2.3.3 Quick Configure

The visual aspects of the Navigation Panel can be changed using the Quick Configure window. This window is accessed by clicking the right facing arrow in the lower left corner of the Navigation Panel, as shown in Figure 12.

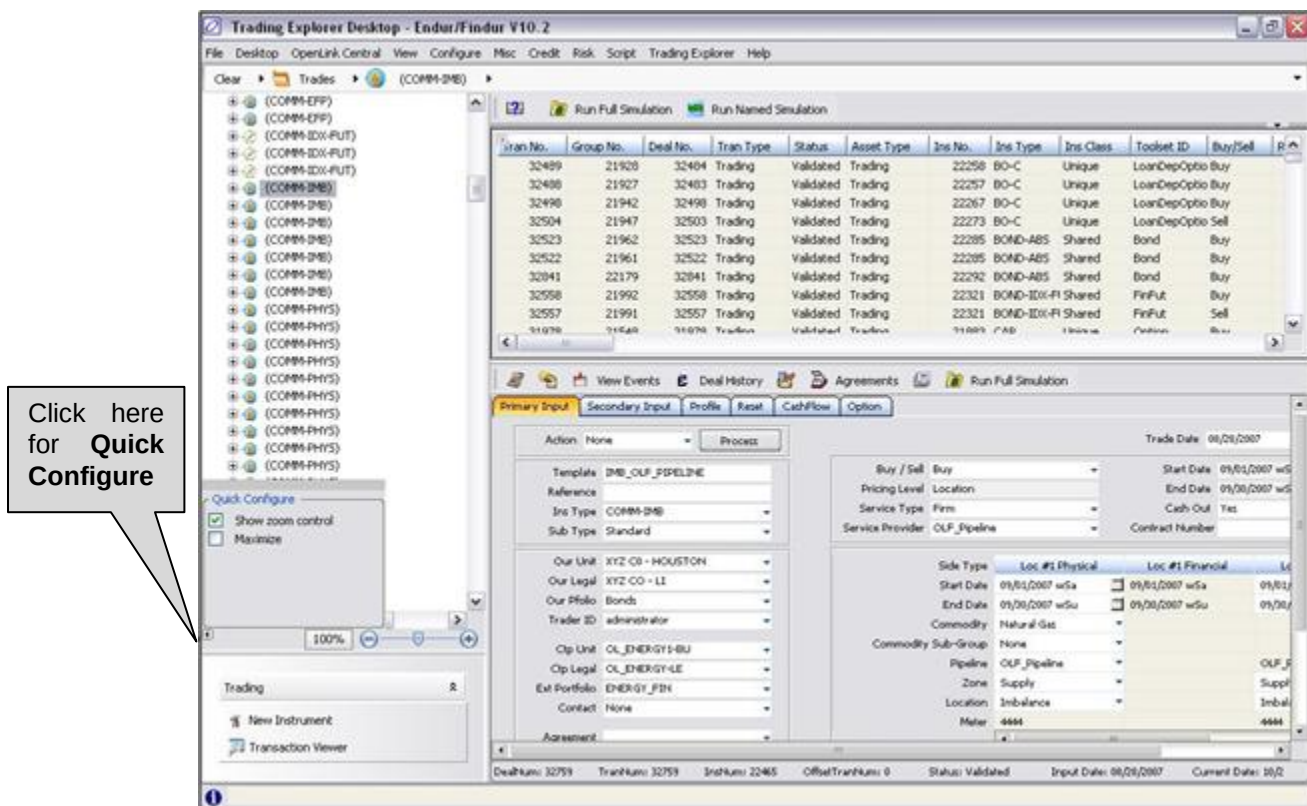

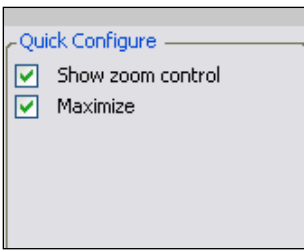

Figure 12. Quick Configure Window

The Quick Configure window offers the following options:

Quick Configure Window	Item	Description
	Show zoom control	Displays the zoom control slide bar on the lower right side of the panel to allow the user to enlarge or reduce the type size of the contents of the <i>Navigation</i> panel. 
	Maximize	Fills the whole desktop with the contents of the <i>Navigation</i> panel for easy display of a large set of data.

2.3.4 Navigation Panel—Find

The Trading Explorer Desktop contains a powerful *Find* feature that can be used to find any information (trades, personnel, portfolios, etc.) displayed in the Navigation Panel. When an item is found, the Find function expands the node(s) to expose the nested data for viewing. The Navigation Panel, Navigation Trail, Trade Listing Panel, and Trade Editor Panel are all updated according to the “found” object.

Use *Ctrl-F* to bring up the Find function, then start typing the first letters of the object you are seeking to perform a Find. Precede the Find with a ‘/’ to match anywhere in the string. Press the Enter key to continue searching forward, or Shift-Enter to search backwards. To stop searching and close the Find function, click the red X button in the Find area.

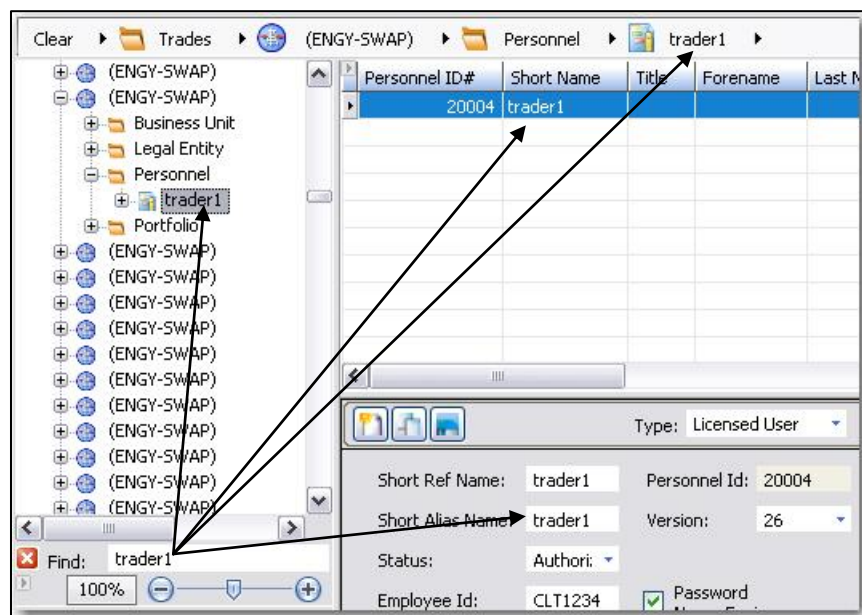

Figure 13. Navigation Panel—Find

2.3.5 Navigation Panel—Query Manager

The *Query Manager* (Figure 14) serves the function of selecting and filtering information from the database. The *Query Manager* utility is standard throughout the OpenLink System. It provides a way to search the OpenLink System database for select information. Search parameters may be very broad, such that many items are retrieved, or parameters can be defined that are specific enough to retrieve just one item.

A query may be executed using the **Query Manager** option from the right-click menu of a folder node from any level of expansion where a node is used for grouping (Business Unit, Legal Entity, Portfolio, etc.).

The fields listed for Selected Values will vary depending on:

- The node from which the query was executed
- The tab from which data will be linked

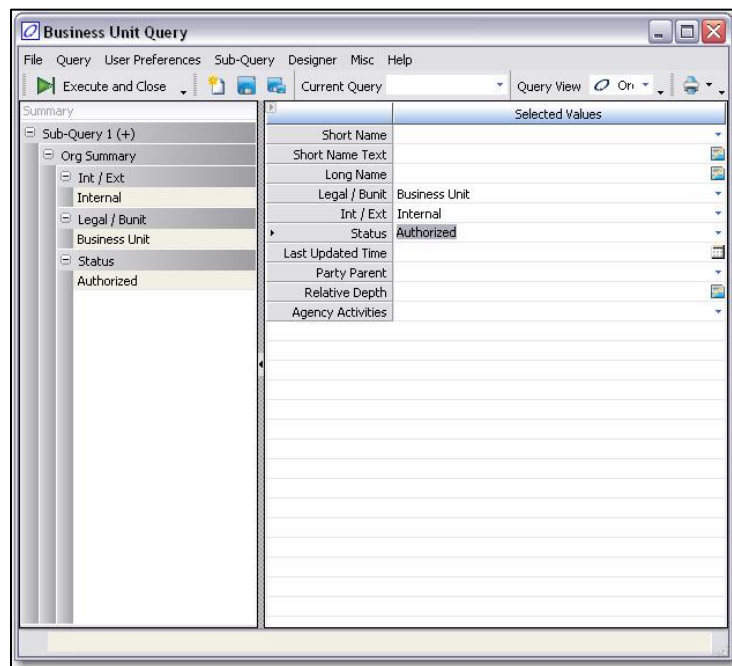

Figure 14. Navigation Panel—Query Manager

2.3.6 Navigation Panel—Filter Criteria

While a query would apply globally to all the data in the Navigation Panel, *Filter Criteria* may be applied to one or more primary level folder nodes for tailored views of the information in the folder(s). This is particularly useful in limiting the data presented in the Trade Listing Panel. For example, it is possible to view only COMM-PHYS trades, as shown in Figure 15.

The Filter Criteria option is available from the right-click menu of a primary folder node. The *Filter Criteria* window is opened with access to the Query Manager to set filter conditions.

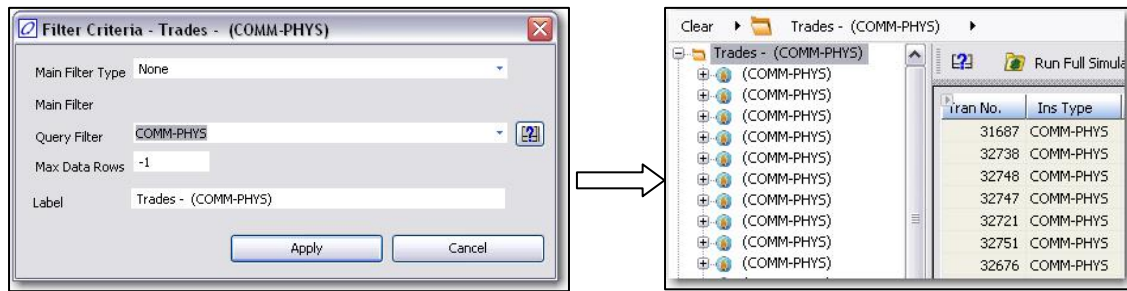

Figure 15. Navigation Panel—Filter Criteria

To clear a filter from the Navigation Panel, right-click on any primary node in the Navigation Panel and select *Clear All Filters* from the pop-up menu.

2.3.7 Navigation Panel—Import/Export

The *Trading Explorer* menu provides functions to **Import** and **Export** all of the element types used by the Trading Explorer Desktop. These elements consist of the following:

- Party
- Party Group
- Personnel
- Portfolio
- Settlement Instructions
- Account
- Party Agreement
- Agreement Condition
- Agreement Language
- Event Documentation
- Client
- Client Sub-Account
- Historical Market Prices Definition
- Historical Market Prices Data

In addition to using the *Trading Explorer* menu options, **Import** may be executed from primary folder nodes and **Export** executed from elements listed in the Navigation Panel. Examples of the Import and Export windows are shown in Figure 16.

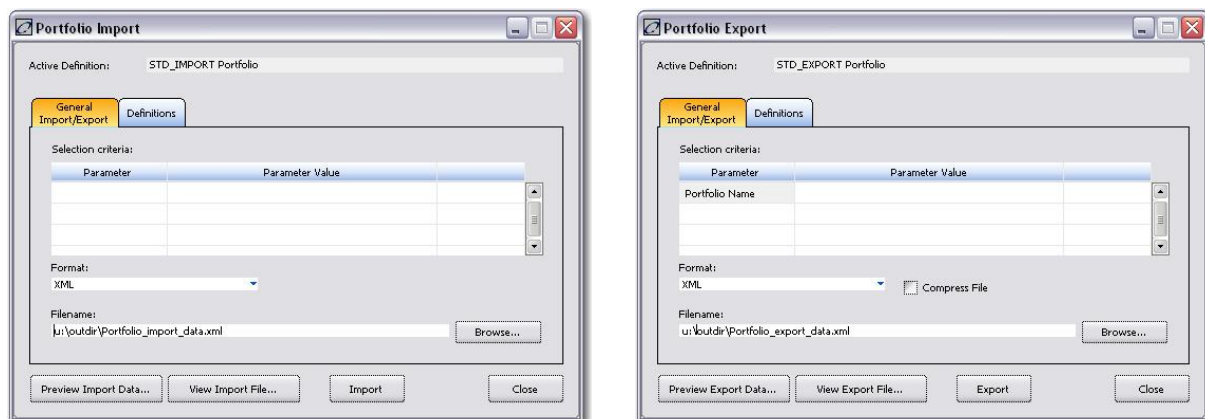

Figure 16. Navigation Panel—Import/Export Options

2.3.8 Navigation Panel—Group Settings

Group Settings can be modified using the *Group Settings* window. This function is accessed via a right-click menu from the Navigation Panel. Options can be set for showing/hiding groups, setting query options, and controlling the number of rows displayed in a group.

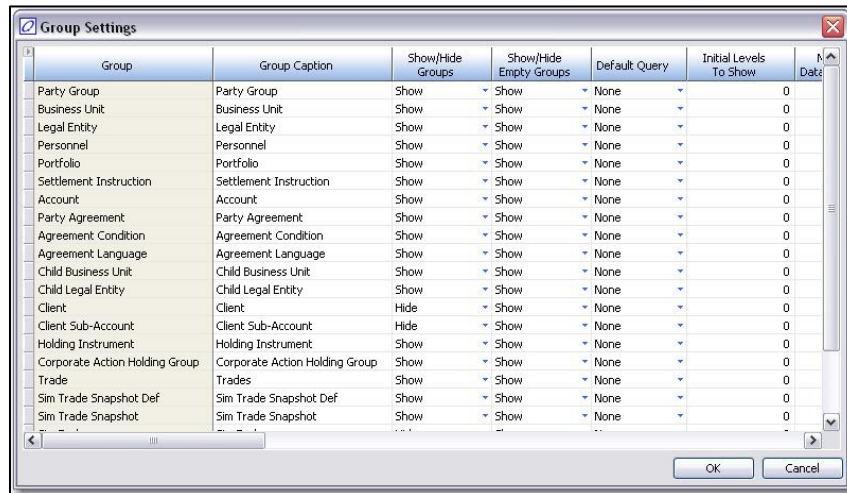

Figure 17. Navigation Panel—Group Settings Window

2.3.9 Navigation Panel—Compare

The Compare function is used to visually compare like objects or different versions of a single object. The object types supported by the Compare function are Trades, Business Units, Legal Entities, Personnel, Portfolios, Accounts, and Settlement Instructions.

To perform a comparison, select two data objects within a group in the Navigation Panel, right-click on one of the objects, and choose *Compare* from the pop-up menu. The Comparison window applicable to the object type will open. A comparison between two deals is shown in Figure 18.

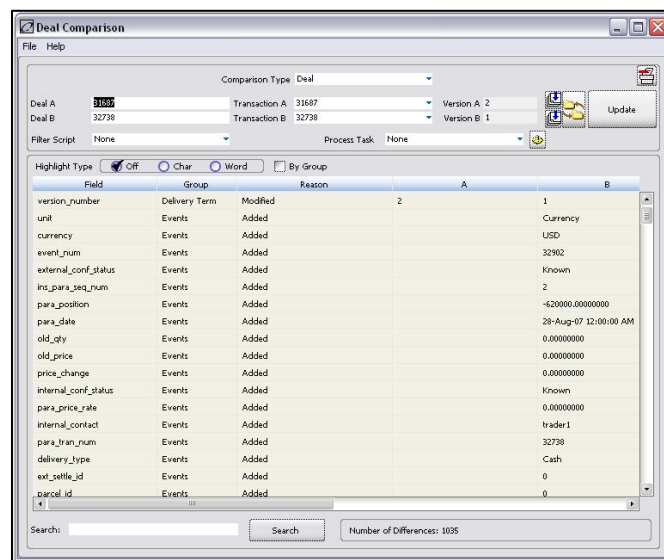

Figure 18. Deal Comparison Window

2.4 Trade Listing Panel

The Trade Listing Panel provides a detailed listing of data objects associated with the business object (such as a trade) selected in the Navigation Panel. When an object is selected in the Trade Listing Panel, the details are loaded into the Trade Editor Panel.

2.4.1 Trade Menu

The *Trade* menu contains options for viewing and working with deals, such as running simulations, performing deal comparisons, and viewing deal events. Users can also create new trades and delete existing trades from this menu.

To display the Trade menu, right-click on a deal in the Trade Listing Panel. The menu appears as shown in Figure 19.

The majority of the functions on the *Trade* menu are described in section 4.0 of this manual, as well the *Online Help User Guide*.

2.4.2 Trade Listing Panel—Quick Configure Menu

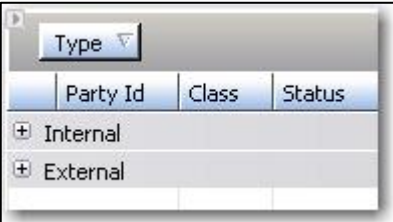

The visual aspects of the Trade Listing Panel can be modified by the user through the use of the Quick Configure menu. In addition to other options, data can be grouped for viewing convenience and visually analyzed with a variety of chart formats. A zoom control is provided to modify the view.

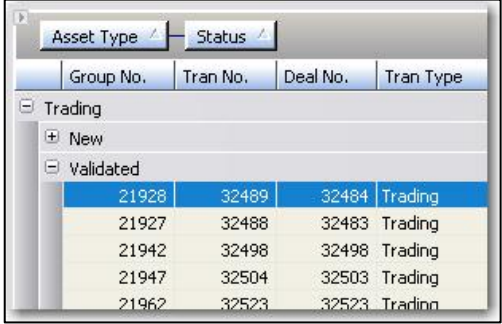

To access the menu, click the right-facing arrow  in the upper left corner of the panel. Check the options for activation in the *Data Listing*.

The table that follows describes the functions available in the **Quick Configure** menu.

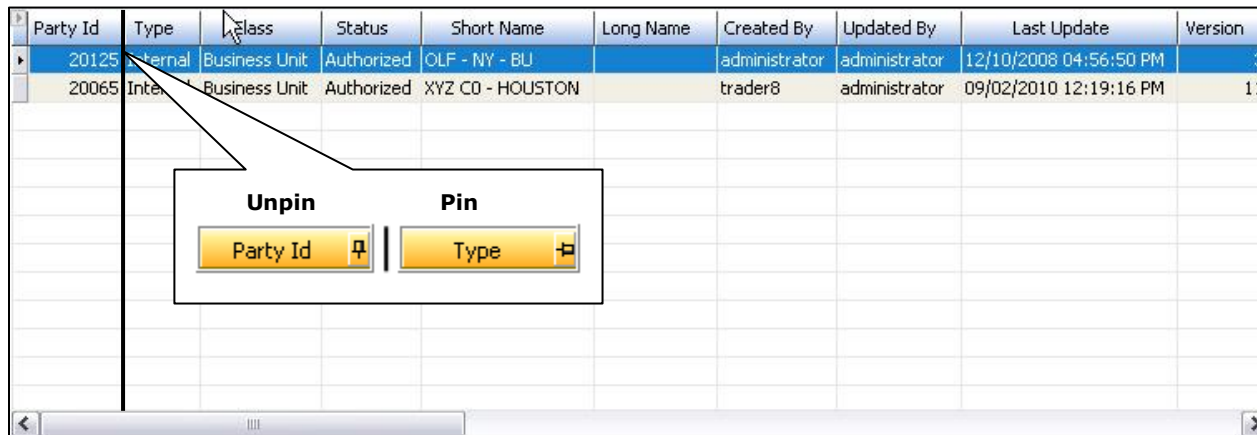

Figure 19. Trade Menu

Quick Configure Menu	Description
Group as tree	Set the grid view to display in a tree view. This function is used together with the Show grouping control described below. 
Show zoom control	Display or hide the Zoom control located at the bottom of the applicable panel. 
Show grouping control	Display or hide the grouping control. When selected, an open field displays at the top of the table. Drag and drop

Quick Configure Menu	Description
	one or more columns, on which to group the table, to the open field. The figure below shows the Trade Listing Panel grouped by the Asset Type and Status. 
Maximize Grid	Expands the contents of the Trade Listing Panel into a full screen display. Unchecking this option returns the panel view to normal.
Show Charts	Provides access to the <i>Charts Configuration</i> window where a variety of options are available to view statistical compilations of the data in the <i>Data Listing</i> . Results are displayed via a Chart tab added to the <i>Data Listing</i> .

2.4.3 Trade Listing Panel—Pin Column

Columns can be pinned in the Trade Listing Panel to keep them visible during horizontal scrolling. To lock/unlock column scrolling in the panel, hover over the column header and click the Pin/Unpin icon. A vertical line on the right side of a column indicates that all columns to the left of the line are pinned and will remain visible.

Party Id	Type	Class	Status	Short Name	Long Name	Created By	Updated By	Last Update	Version
20125	Internal	Business Unit	Authorized	OLF - NY - BU		administrator	administrator	12/10/2008 04:56:50 PM	
20065	Internal	Business Unit	Authorized	XYZ CO - HOUSTON		trader8	administrator	09/02/2010 12:19:16 PM	1

Figure 20. Trade Listing Panel—Pin/Unpin Columns

2.5 Favorites Panel

Shortcuts can be added to the Trading Explorer Desktop. Through the Favorites Panel, a user is provided direct access to their commonly used services from within the Trading Explorer Desktop. For example, the *Trading* favorites shown in Figure 21 provide access to familiar windows available in Trading Manager. New tabs can be added or removed from the tab organization. Options are also provided to import and export favorites.

Figure 21. Trading Favorites

To manage favorites:

1. Display the OpenLink Central menu by right-clicking in the Favorites Panel.
2. Select Load Configuration to use an existing configuration.
3. Select Edit Configuration to open the OpenLink Central Configuration window (Figure 22).
 - a. Use the *Tab Configuration* tab to add, delete, or copy tabs.
 - b. Use the *Button Configuration* tab to select the desired services to make available from a tab.

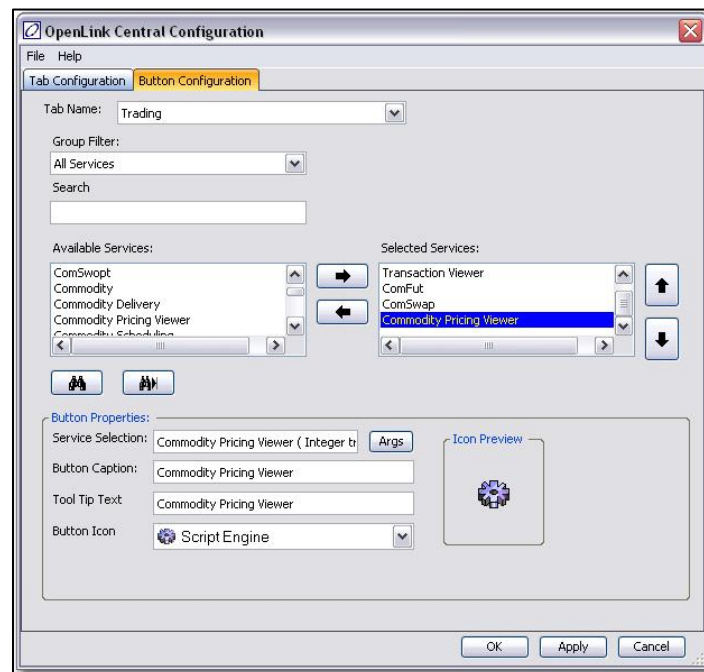

Figure 22. OpenLink Central Configuration Window

2.6 Trade Editor Panel

The Trade Editor Panel displays the details of a trade or other type of data object selected in the Trade Listing Panel. Some data objects divide the Trade Editor Panel into multiple panels. Tabs are utilized when access to relevant details about a selected object are available.

In the example below (Figure 23), the Trade Editor Panel is displaying detailed information for a specific trade.

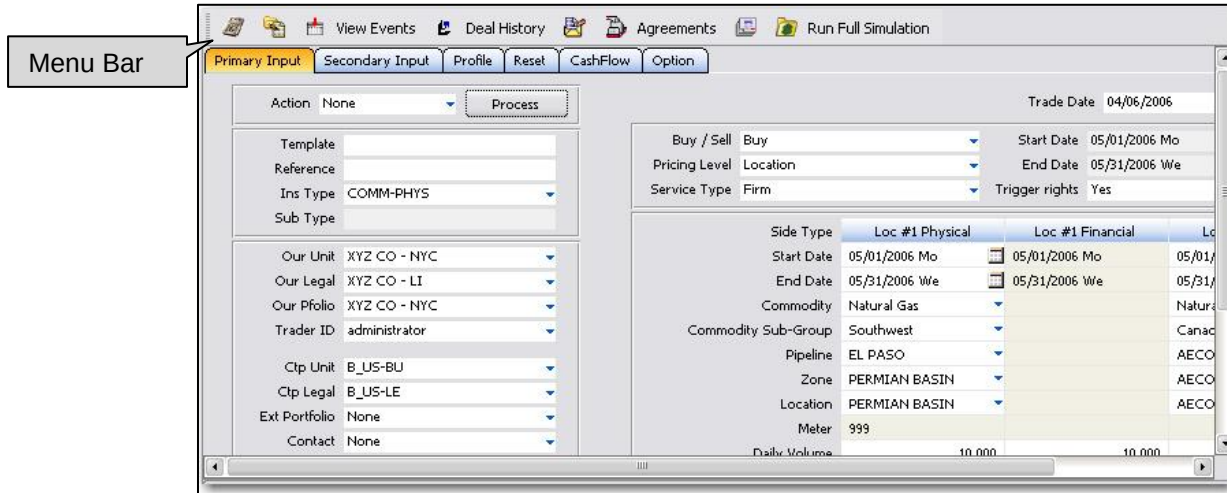

Figure 23. Trade Editor Panel

Business objects can also be modified directly in the Trade Editor Panel. For example, in the deal shown above, elements of the deal such as its **Instrument Type** and **Start Date** can be modified.

There is also a menu bar across the top of the panel. The options on this menu allow users to perform tasks specific to the type of object selected (e.g., create a new business unit, save a legal entity, etc.).

2.7 Navigation Trail

The Navigation Trail displays the current path taken through the Navigation Panel. The Navigation Trail allows users to:

- Quickly navigate to any point in the trail by simply selecting one of the steps in the path
- Click the right-facing arrow  of any of the steps for options to change the trail direction from anywhere along the path
- Click the down-facing arrow  at the far right end of the *Navigation Trail* to revisit a previously used trail

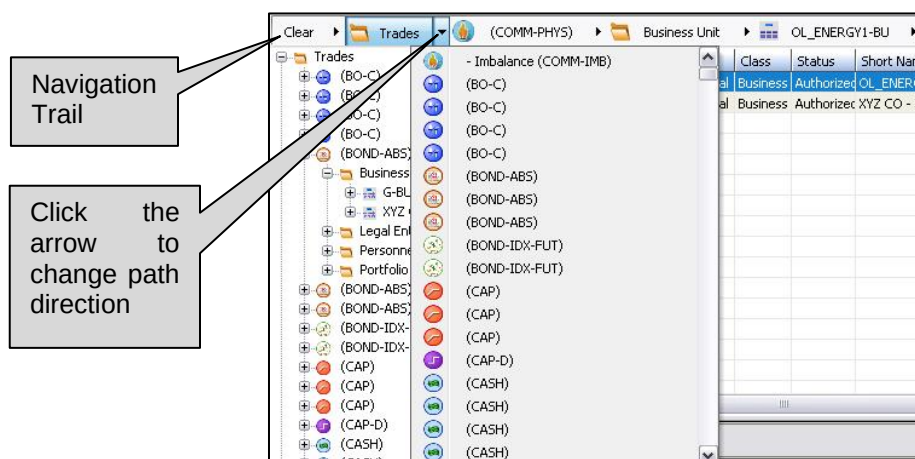

Figure 24. Navigation Trail

2.8 Reconfiguring Panels

Any of the four panels of the desktop can be “unlocked” and repositioned on the screen, then locked again into new positions. This allows users to view each of the panels in a separate window and rearrange the screen layout.

To unlock the screen panels:

1. Select **Unlock Panels** from the View menu.

A caption appears at the top of each panel. For example, when unlocking the Trade Listing Panel, the caption reads “Trade Listing.”

2. Click in the caption area to drag the panel(s) into the desired position(s).

Panels can be repositioned to various areas of the screen, as shown in Figure 25.

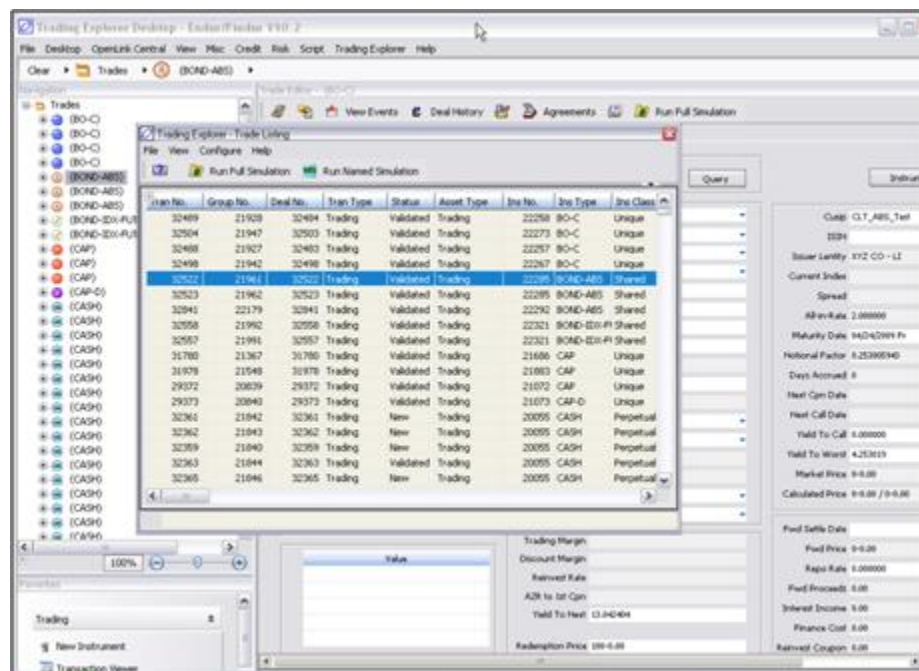

Figure 25. Trade Listing Panel Unlocked

3. To detach the panel from the screen so it “floats,” double-click in the caption area.

Alternatively, right-click in the caption area and select *Floating* from the pop-up menu.

Floating windows are separate from the desktop and can be manipulated similar to other windows. Floating panels can be returned to the desktop by double-clicking in the caption area and selecting **Hide** from the menu.

4. To lock the panels into their new positions, select **Lock Panels** from the View menu.

2.9 User Preferences

The size and placement of the panels in the Trading Explorer Desktop can be saved as a user preference. To save the current arrangement of the screen, select **Save User Preferences** from the *Desktop* menu. Once saved, the new preferences override any preferences saved with the desktop definition.

To delete all user preferences, select **Delete User Preferences** from the *Desktop* menu.

2.10 Tabs

Adding tabs provides the option of displaying additional desktop views from the existing desktop. From the *Desktop* menu, select *Tab Management*. Add or remove tabs using the *Tab Management* window.

Figure 26. Tab Management Window

2.11 Desktop Navigator

The Desktop Navigator shows a tree of the various panels in the desktop, broken down by tabs (see section 2.10). Since the Trading Explorer Desktop allows panels to float freely, the user can use Desktop Navigator to locate a tab or panel that has moved out of view. Also, the user can float or dock any panel in any tab directly from the Desktop Navigator. Select **Desktop Navigator** from the *View* menu to display it, as shown in Figure 27.

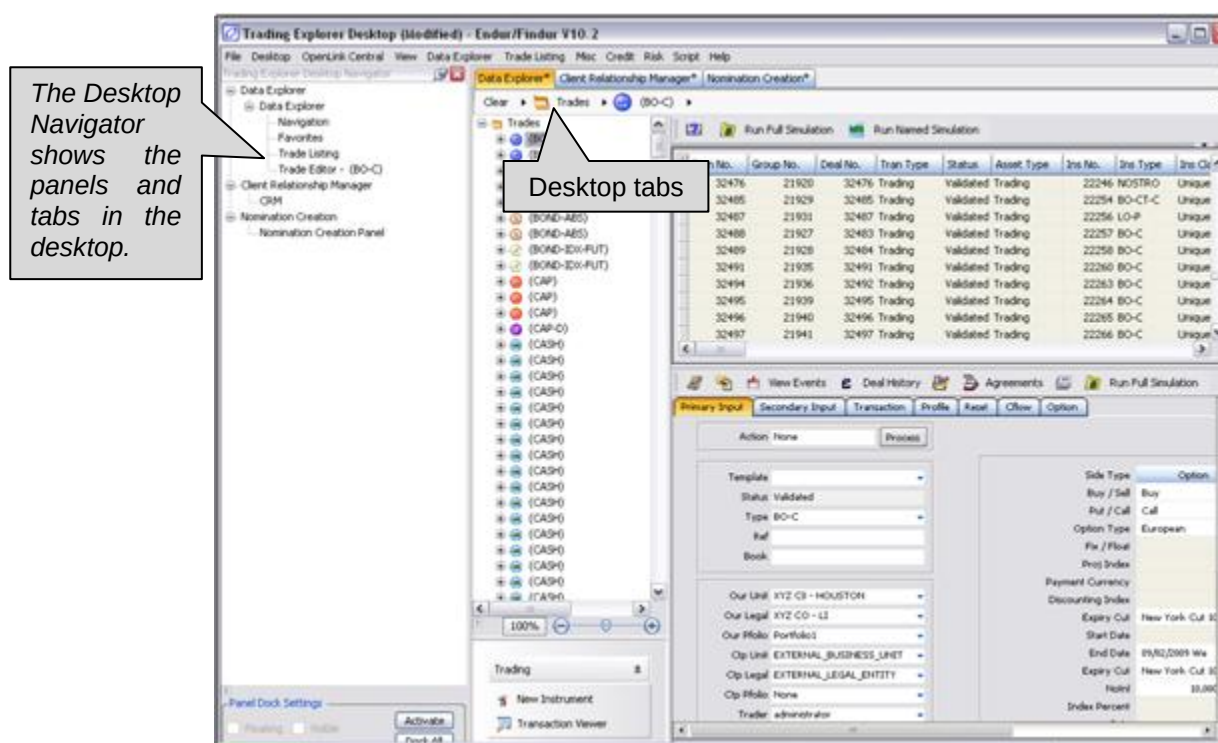

Figure 27. Desktop Navigator

2.12 Refreshing Objects

There are times when the data within the various panels of the Trading Explorer Desktop need to be refreshed to display the most up-to-date data. For example, refreshing the screen is usually necessary after modifying a trade in a separate Trade Input window.

To refresh the display, select **Refresh** from the *Trading Explorer* menu.

2.13 OpenLink Central Sidebar

The OpenLink Central sidebar displays all of the objects and menu items within the OpenLink Central control panel, showing them vertically down the left side of the Trading Explorer Desktop for easy access.

To display the sidebar, select **Show OpenLink Central Sidebar** from the *View* menu. The sidebar appears on the left side of the desktop, as shown in Figure 28.

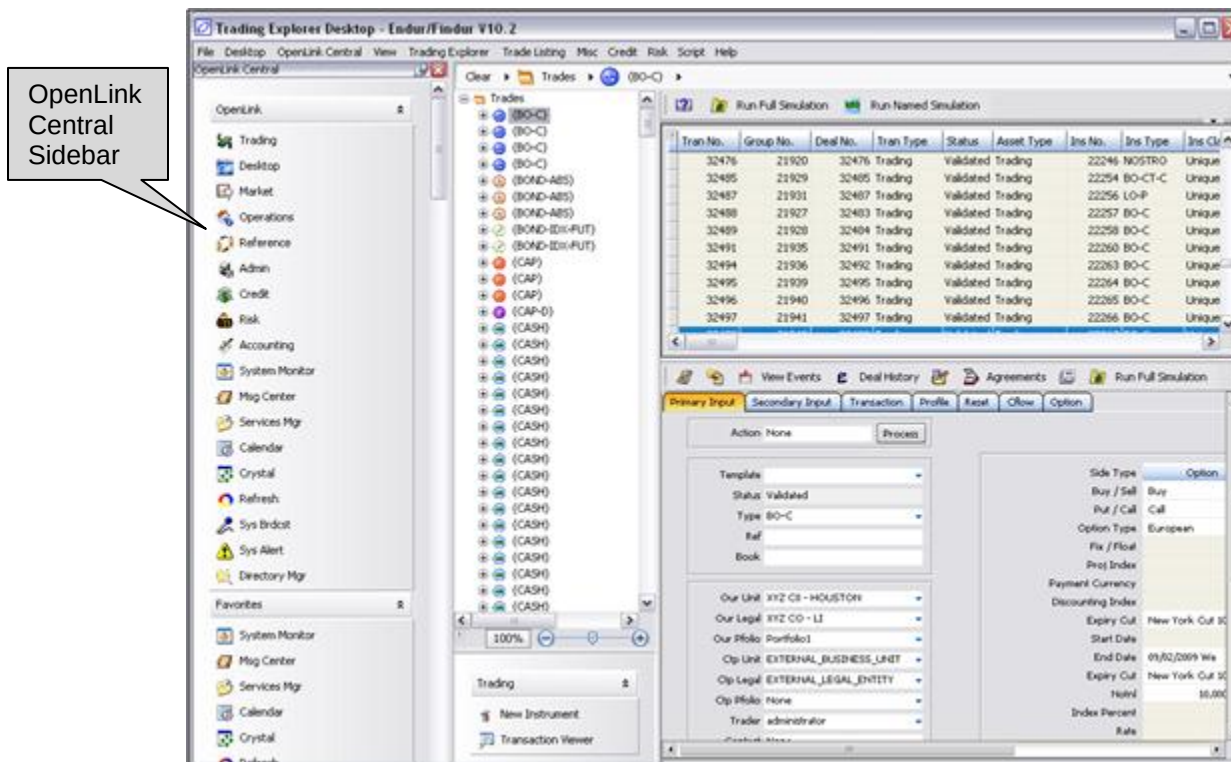

Figure 28. OpenLink Central Sidebar

3.0 WORKING WITH TRADES

The Trading Explorer Desktop provides a single, unified space for working with trades. All the functionality of the Trading Manager is available within the Trading Explorer Desktop. From here a user can create new trades, view and compare trades, and modify trades. Many supporting functions are also available, such as viewing the history of deals and running simulations.

As described previously, the *Trades* folder is the first and only primary node that appears in the Navigation Panel when the Trading Explorer Desktop is started. This folder contains all of the trades existing within the OpenLink system. Selecting a trade here populates the Trade Listing Panel with trades, with the selected trade highlighted. Details of the selected trade also appear in the Trade Editor Panel.

Whenever a new trade is created it is added to the list of trades in the Navigation Panel. Once created, trades can be modified in the Trade Editor Panel. The Trading Explorer Desktop also includes a Transaction Viewer that allows users to view transaction information to any selected deal.

Selecting a trade in the system also changes the main menu at the top of the Trader Explorer Desktop (see Figure 30), allowing the user to view data about the deal (e.g. deal comments), configure the Trade Listing Panel, run scripts and credit checks, and so on.

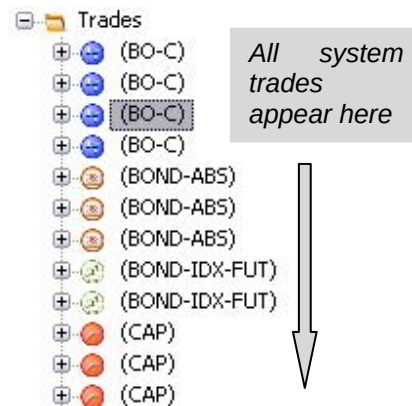

Figure 29. The Trades Folder

Figure 30. Main Menu—Deal Selected

The functions on this menu are described within the *Online Help User Guide*.

3.1 Creating a Trade

New trades are created using the same instrument types and input screens as in the Trading Manager. To create a trade in the Trading Explorer Desktop, follow the procedure below:

1. From the *OpenLink Central* menu (located in the main menu bar at the top of the screen), select **Trading**, and then select **New Instrument**.

A pick list of instrument types configured for the system displays (see Figure 31).

2. Select the applicable instrument type from the list.

The input screen for that instrument type displays. For this example, the commodity input screen appears, as shown in Figure 32.

Figure 31. Instrument Pick List

Figure 32. Commodity Input Screen

3. Enter the trade data into the instrument input screen.

The input fields for each instrument are described in the *Online Help User Guide*. Enter all the applicable data as required for the trade.

4. Process the trade.

To do so, choose the method for processing the trade in the **Action** field, then click **Process** (see Figure 33). (For a description of each processing method, refer to the *Online Help User Guide*.)

Once the trade is processed, it appears in the Navigation Panel and Trade Listing Panel. It is now part of the system and can be modified, viewed, and so on.

Note: If the trade does not appear, refresh the desktop by selecting **Refresh** from the *Trading Explorer* menu.

Figure 33. Processing a Trade

New Trades can also be created through the Trade Listing Panel or directly from the Navigation Panel. This method does not bring up a separate instrument input screen, but rather calls up the input screen directly in the Trade Editor Panel.

To create a new trade using this method:

1. Right-click on a trade in the Navigation Panel or in the Trade Listing Panel.

A menu of options appears. These options differ between the Navigation Panel and Trade Listing Panel, but both menus contain a **New Trade** option.

2. Select **New Trade** from the menu.

A pick list of instrument types appears.

3. Select the applicable instrument type from the menu.

The input screen for that instrument type displays in the Trade Editor Panel. For example, if **ComSwap** is selected as the instrument type, the instrument input screen appears as shown in Figure 34.

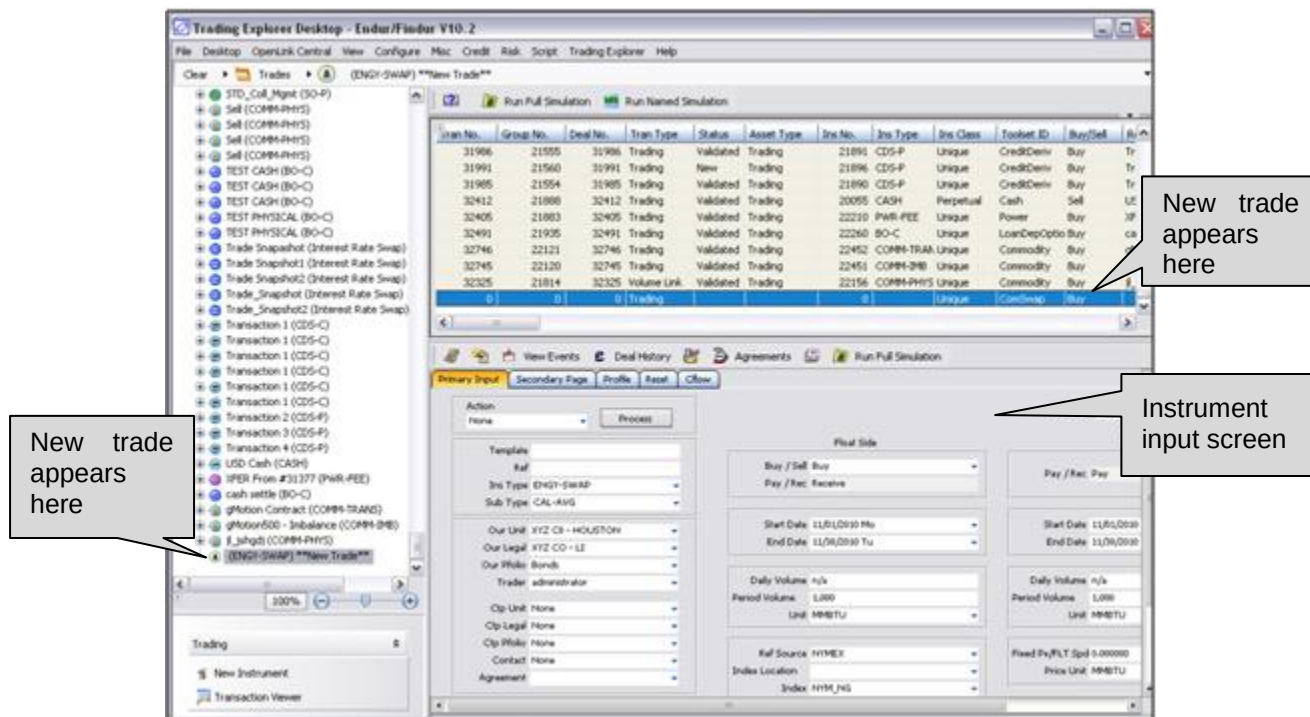

Figure 34. New Trade in Trade Editor Panel

From here the trade data is entered and the trade processed in the same manner as previously described.

3.2 Modifying a Trade

Already existing trades can be modified using the Trading Explorer Desktop. To modify a trade:

1. Locate the trade to be modified.

Trades can be located by scrolling through either the Navigation Panel or Trade Listing Panel. Trades can also be located via the Transaction Viewer. Details for selected trades appear in the Trade Editor Panel.

2. Modify the trade data.

Using the editable fields in the Trade Editor, modify the trade as applicable. Refer to the *Online Help User Guide* for information about these fields and screen tabs.

3. Process the trade.

Choose the method for processing the trade in the **Action** field, then click **Process**. Previously validated deals that are modified have a status of “Amended.” Refer to the *Online Help User Guide* for a description of these processing options.

Note: Double-clicking on a trade in the Trade Listing Panel brings up a separate instrument input window for the trade. The trade can then be modified within that window. Panels can also be “unlocked” from the desktop by selecting **Unlock** from the View menu.

3.3 Clearing Trade Data

The *File* menu provides a number of options for clearing the data from a trade input window. This can be useful when creating numerous trades. For example, clearing just the deal or transaction number can be useful when creating transactions that have the same deal information (i.e., portfolio, counter party data, start/end dates, etc.).

Each of these *File* menu options are described below:

Clear All	Clears all the user-defined information and resets all system generated numbers to zero. Sets the screen back to its default settings.
Clear Deal/Ins Number	Clears the instrument, transaction, and deal number. Changes the status to “Pending,” resets the Trader ID to the user that is logged in to the system, and retains most deal information. This functionality is useful in creating new deals that have the same deal information. Warning: Clearing the Instrument Number does NOT always copy an existing deal exactly. There are several cases where a deal will not be copied exactly.
Clear Tran No.	Clears the instrument, transaction, and deal number. Changes the status to “Pending,” resets the Trader ID to the user that is logged in to the system, and retains most deal information. This is useful in creating new deals that have the same deal information.
Clear to Template	Clears the transaction information and returns to the selected template.
Clear to Default Template	Clears the transaction information and returns to the default template.

3.4 Configuring the Trade Listing Panel

The layout of the Trade Listing Panel can be configured to present only certain types of data or to display data in specific ways. Once created, Trade Listing Panel configurations can be saved to quickly change between layouts. The options to configure the Trade Listing Panel are available from the *Configuration* menu (see Figure 35).

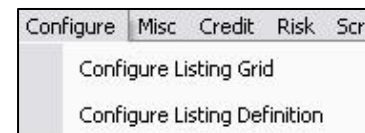

Figure 35. Configuration Options

3.4.1 Configure Listing Grid

When the Trade Listing Panel first appears the default configuration is loaded automatically. Users may change this default configuration, or create separate configurations for loading. The configuration controls such things as how trades are grouped, the columns that are displayed in the listing, and so forth.

To configure the Trade Listing Panel:

1. Click the *Configure* menu and select **Configure Listing Grid**.

The **Configuration** window appears (Figure 36).

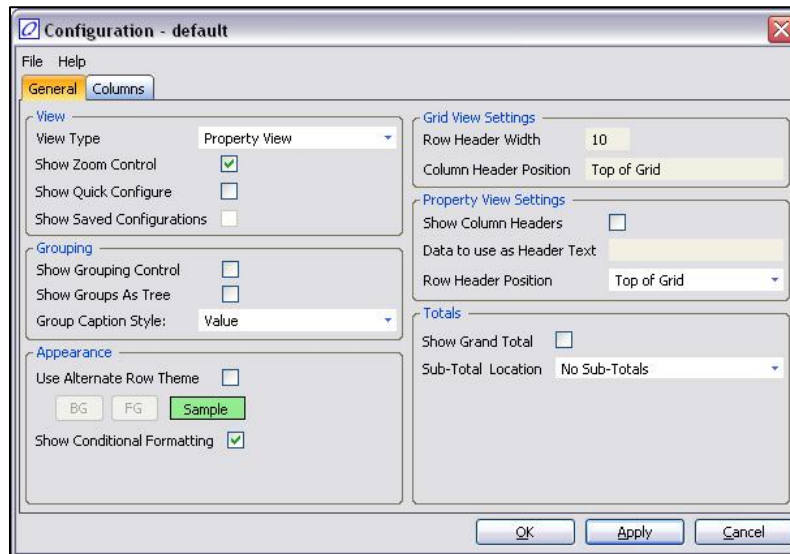

Figure 36. Trade Listing Configuration Window

From here you can modify the loaded configuration or load a different configuration to apply/modify. Modifications can be made in two tabs—the *General* tab, which controls view options, grouping options, and the general appearance of the trade listing, and the *Columns* tab, which controls how the columns of the trade listing are arranged.

- To modify the existing configuration, use the tabs/fields of the window to change the trade listing as desired, and then click the **Apply** button
- To load a different (i.e. previously saved) configuration, select **Load** from the *File* menu and select the desired configuration
- To set the current configuration as the default configuration for the Trade Listing Panel, select **Set as Default** from the *File* menu
- To create a new configuration from the current configuration, select **Save As** from the *File* menu. Then choose a name for the configuration in the window that appears and save it

2. Once the changes have been applied, click **OK** to close the Configuration window.

Note: For more information on using the grid, including information on conditional formatting and charting, refer to the *.NET GUI Data Grid User Guide*.

3.4.2 Configure Listing Definition

In addition to changing the configuration of the Trade Listing Panel, users can also change the *definition* associated with the panel. Unlike configurations, definitions have scripts associated with them. These scripts control what trades are displayed in the listing by querying for trades with specific parameters, such as instrument type. In addition, definitions can also control the same trade listing viewing options as a configuration.

To configure listing definitions:

1. Click the *Configure* menu and select **Configure Listing Definition**.

The **Trade Listing Definition** window appears (Figure 37).

Figure 37. Trade Listing Definition Window

From here the user can load and modify existing definitions or create new definitions. Configuration options can also be assigned to definitions from the bottom portion of this window.

The fields in the top portion of this window are described below:

Field	Description
Definition	Displays a pick list of available customized trade listing definitions. This list lets the user view trades according to the selected definition. For example, selecting a T-Bill Listing definition will display the T-bill trades.
Query Name	Displays a pick list showing the list of saved queries. The query is automatically executed when the definition is accessed.
Include Ins Details	Use this field to add fields stored in the header table to the Trade Listing panels. This includes fields such as ticker, ISIN, and CUSIP. No: This is the default value. No, do not add fields. Yes: Additional information will be brought into the trade listing from the header table (formatted to the appropriate reference table).
Load Script	Opens the Loading Script window for selection. The load script allows the user to attach a plug-in that will be activated on initial loading or updating to customize the columns or data in the Trade Listing Panel.
Process Script	Opens the Trade Processing Loading Script window for selection. This allows the user to select a process script (plug-in) to run any time the “Execute Process Script” functionality is accessed. “Execute Process Script” action can be selected and set on the toolbar or from the menu options.

Auto Update Interval	This is the frequency, in seconds, with which the automatic notification engine will update.
Allow ANE Update	Allows automatic notification engine updates. If checked, modifications made by other users are automatically displayed in the trade listing.
Grid Configuration	Calls up a pick list of existing trade listing configurations to associate with the definition.

2. Enter data as applicable in the fields of the window.

- To modify an existing definition, select the definition and make the necessary changes in the fields. A message will appear in red stating that the definition has been modified (Figure 38):

Figure 38. Modified Definition

- To create a new definition, select **New** from the *File* menu and enter the applicable data for the definition in the window

3. When the window is complete, click **Apply** to apply the changes, then click **OK**.

3.5 Folder Groups

The **Folder Groups** feature allows trades in the Navigation Panel to be logically grouped. To access Folder Groups, right-click on a data object in the Navigation Panel (for example, Trades) and then select **Folder Groups**. In the screen that displays (Figure 39), select the desired folder grouping and labels. The default is to group by Toolset ID, then Int Pfolio, with the default labels Deal No. and Reference. The default setting is displayed in the Navigation panel (Figure 40).

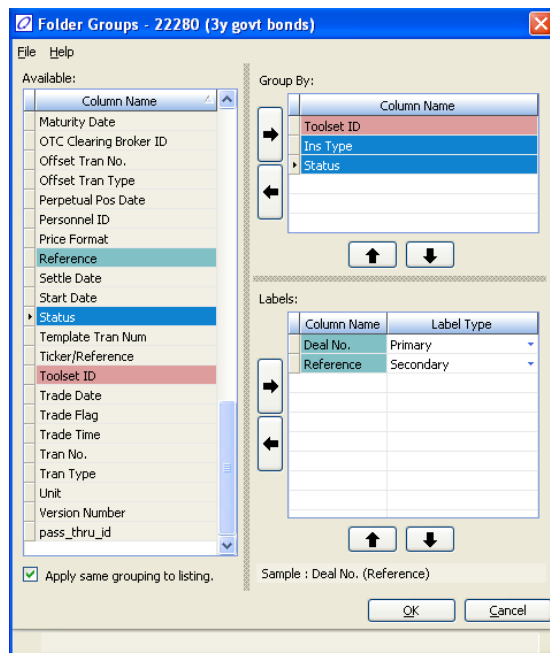

Figure 39. Folder Groups Window

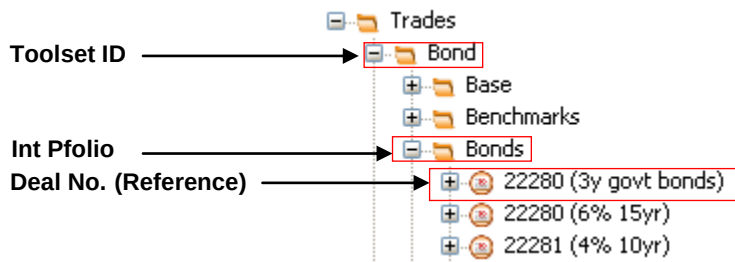

Figure 40. Default Folder Groups in the Navigation Panel

Note: To return the Navigation panel to its default setting, right-click on the Trades node and select **Clear Folder Groups to Default**.

Screen Item		Description
Available window		Contains a list of column names that can be added to the Group By or Labels window.
Group By window		A user selects the desired columns to group the entries within the Navigation panel. Note: The same column name cannot be used in both the Group By window and the Labels window.
Labels window	Column Name	The column name (e.g., Deal No.) is used as the label for the items contained within the desired folder grouping.
	Label Type	When the selected column name (e.g., Deal No.) is set to primary, it displays first in the label. When the selected column name is set to secondary (e.g., Reference), it displays at the end of the label in parenthesis. Note: The same column name cannot be used in both the Group By window and the Labels window.

Screen Item	Description
Sample : Deal No. (Reference)	Indicates the text label displayed for a given trade within the Navigation panel based on how it was configured in the Labels window.
Apply same grouping to listing.	By checking this option the Navigation panel folder grouping gets applied to the Trade Listing panel. Note: Assigned labels do not display in the Trade Listing panel.
	Moves the highlighted column name from the Available window to the Group By or Labels window.
	Moves the highlighted column name from the Group By or Labels window to the Available window.

	Moves the highlighted column name up in the Group By or Labels list.
	Moves the highlighted column name down in the Group By or Labels list.

Select **OK**. The Folder Groups screen closes and the Navigation panel is updated (Figure 41). In this example the Trade Listing panel was also updated to mirror the Navigation panel because **Apply same grouping to listing** was checked in the Folder Groups screen.

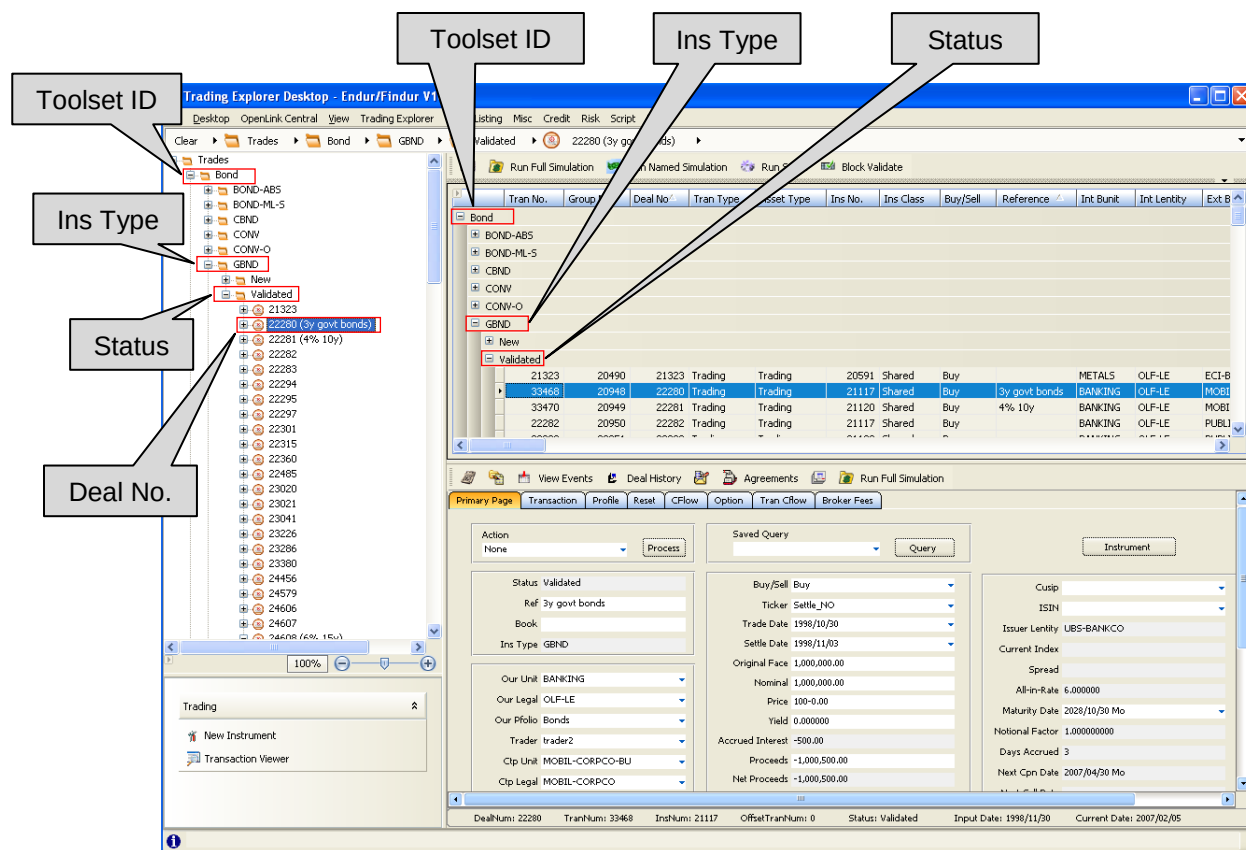

Figure 41. Folder Groups in the Navigation Panel are mirrored in the Trade Listing Panel

3.6 Comparing Trades

The Trading Explorer Desktop contains a compare function that allows users to compare two different trades, as well as compare other types of like data objects (such as business objects or legal entities).

To compare two trades, follow the procedure below:

1. With the **Ctrl** key depressed, select two trades in the Navigation Panel.
Make sure both trades are highlighted.
2. Right-click on one of the selected trades, then select **Compare** from the menu.

The Deal Comparison window appears as shown in Figure 42.

Note: The compare function can also be accessed by selecting **Deal Comparison** from the **View** menu, or by selecting **Misc, Deal Comparison** from the *Trade Listing* menu.

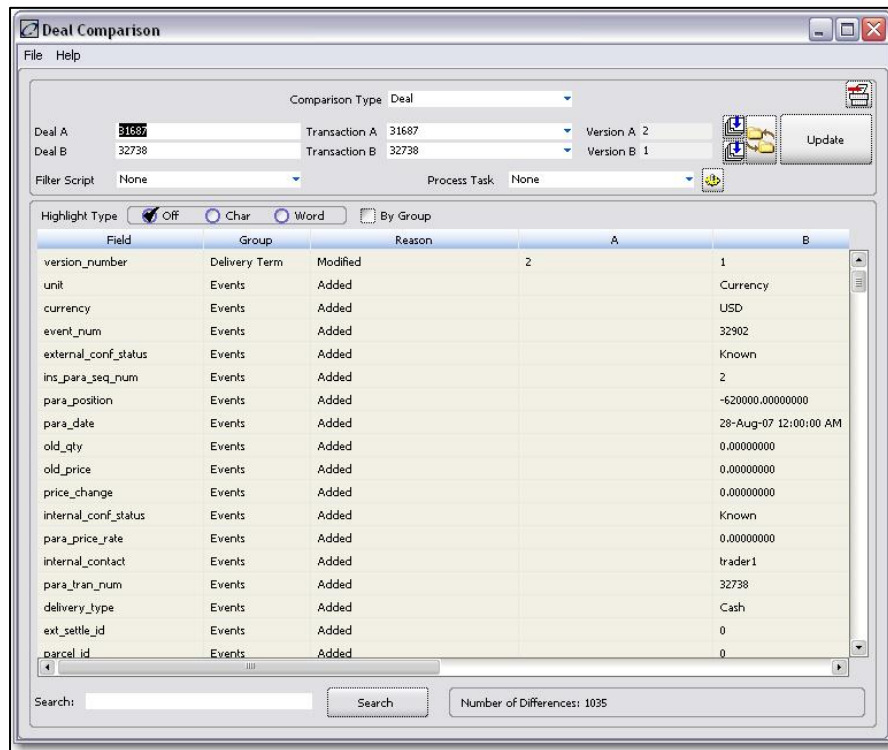

Figure 42. Deal Comparison Window

The listing panel portion of the window displays information about the selected trades, allowing the user to compare them side by side. Users can search for specific strings of data using the Search feature at the bottom of the window. The **Number of Differences** between the two trades is also displayed.

The fields in the top of the window allow the user to control what is displayed in the listing panel of the window. These fields are described below:

Field	Description
Comparison Type	Displays a pick list of definitions that determines which data comparison screen to display.
Deal A	The first instrument transaction selected for comparison. This number remains the same throughout the life of the deal.
Deal B	The second instrument transaction selected for comparison. This number remains the same throughout the life of the deal.
Transaction A	The first instrument transaction number This number changes as the deal is amended.
Transaction B	The second instrument transaction number This number changes as the deal is amended.
Version A	Number of times the first instrument was amended.
Version B	Number of times the second instrument was amended.
Filter Script	This script can modify the comparison data in the table. The following can be done in the script:

	- Delete rows—Remove rows that are not important to the user - Change data in the table—Set information for each record that is important to the user. One example is changing the data in the description column to data that may be helpful to the user to identify which record has changed - Change the grouping on the table—Group or sort the table. If the user chooses to display the data on the screen in tree view mode the tree view will be based on the grouping
Process Task	Displays a pick list to select an existing script to run on the Comparison Data. A table of the comparison Data will be passed to the task. The task may run a report on this data.
Highlight Type	The differences in each field can be highlighted to show exactly what has changed. To toggle between highlight types, select the corresponding radio button. Off: Do not highlight changes Char: Highlight what changed character by character Word: Highlight what changed word by word
By Group	Create a tree view with the default grouping that is group, reason, and unique.

The listing panel portion of the window lists the selected deals and the details about each one. The columns in the listing panel are described below:

Field	Description
Field	Displays the field name that was changed in the deal.
Group	Displays the group the field is in; for example, header, profile, transaction, and so forth.
Reason	Identifies the reason for the difference (Modified, Added, or Deleted).
A	Displays the formatted value for the field in object A.
B	Displays the formatted value for the field in object B.
Net Difference	Displays the net difference between Column A and Column B (where applicable). Note: Some date fields such as start date and end date are displayed as symbolic dates, if that is how they were entered. A Net Difference will not be shown for such fields.
Unique	Displays the fields that make this record unique to identify what record changed.
Description	Displays a general description of the record.

3.7 Trade Snapshots

The trade snapshot functionality gives users the ability to save a particular state of a trade into the database for preservation so that the same versions of trades can be re-valued at some future point in time, even after amendments or trade maintenance adjustments have been entered in those trades.

Trade snapshots in the Trading Explorer Desktop are captured through a function in the *Misc* menu and managed via the Deal History function (see section 4.4).

To create a trade snapshot:

1. Select a trade in the Navigation Panel or in the Trade Listing Panel.
2. Select **Save as Trade Snapshot** in the *Misc* menu.

A snapshot of the trade will be created in the system database. The snapshot can now be viewed in the Deal History window.

Tran No.	Tran Status	Version	User	Update Type	Date/Time	Saved Snapshot
32748	Validated	1	administrator	Transaction Insert/Update	04/09/2010 09:45:12 AM	
32748	Validated	2	administrator	Nomination Creation	04/09/2010 02:37:43 PM	
32748	Validated	3	administrator	Nomination Creation	04/09/2010 02:40:27 PM	
> 32750	Amended New	1	administrator	Transaction Insert/Update	04/13/2010 03:21:18 PM	
> 32748	Validated	4	administrator	Transaction Insert/Update	04/13/2010 03:21:18 PM	✓

Figure 43. Trade Snapshot in Deal History

Trade snapshots are denoted by a checkmark in the *Saved Snapshot* column of the Deal History window, as shown above (Figure 43). From here the user can do a deal comparison between the different transactions of the trade.

To delete a trade snapshot, right-click on the snapshot and select **Delete Saved Snapshot** from the menu.

3.8 Credit and Risk Checks

The Trading Explorer Desktop allows users to check whether trades are within available credit and risk limits. Two types of checks are offered—a quick check and a full inquiry. These functions are available from the *Credit* and *Risk* menus, respectively.

The **Quick Credit/Risk Check** function allows users to run speedy credit or risk checks on prospective counterparties before booking a deal. By running a check in advance, users can see whether there is a line of credit established for a counterparty defined in the System. They can see at a glance whether the counterparty is close to their credit limit, have exceeded the limit, or have been blocked from trading on the system altogether. Furthermore, users can determine whether or not the counterparty has enough left in that credit line to cover a specific deal and numerous details about the counterparty's credit lines.

The Credit/Risk Inquiry function opens the Credit or Risk Inquiry window for the current trade, including the available credit or risk limit for the criteria group.

3.9 Plug-ins

Plug-ins are scripts used to complement or modify the default processing or computations performed by the system. These plug-ins can be run from the Trading Explorer Desktop to modify the data displayed within the Trade Listing Panel.

1. To run a plug-in, select **Run Any Script** from the *Script* menu.

A pick list of available plug-ins appears, as shown in Figure 44.

Note: A trade must be highlighted in order for the *Misc* menu to appear.

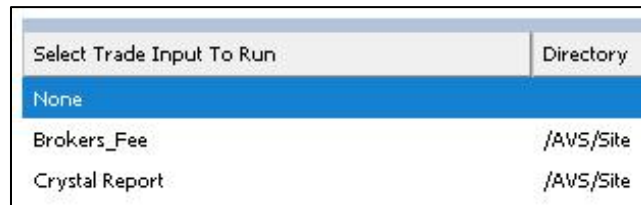

Figure 44. Available Scripts

2. Click on the desired plug-in in the pick list to run it.

Plug-in names can also be configured to appear directly in the *Script* menu, allowing users to click on them directly without first going to the pick list. To do so:

1. Select **Configure Toolset Scripts List** from the *Misc* menu.

A pick list of plug-ins appears, as shown in Figure 45.

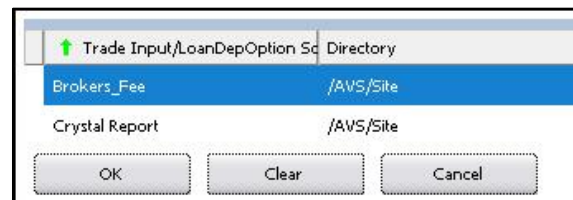

Figure 45. Available Scripts

2. Highlight the names(s) of the plug-ins to add to the *Script* menu, and then click **OK**.

The selected plug-in will appear within the *Script* menu, as shown in Figure 46.

Figure 46. Script Added to Menu

Note: Plug-ins can also be cleared from the *Script* menu by highlighting them in the pick list (see Figure 45) and clicking **Clear**.

3.10 Simulations

Simulations can be run on deals selected in the Navigation Panel or Trade Listing Panel. Simulations are the list of the results that the system computes and records, as well as configurations, mappings, and modifications. The Trading Explorer Desktop allows users to run *full* simulations and *named* simulations. Both functions are explained in this section.

3.10.1 Running Full Simulations

Full simulations are run from the Portfolio Reval window. This window allows simulations to be created, modified, and loaded. To open the *Portfolio Reval* window, select the applicable trade(s) in the Trade Listing Panel and select **Full Simulation** from the *View* menu or click the **Run Full Simulation** button at the top of the Trade Editor Panel. The window appears (Figure 47):

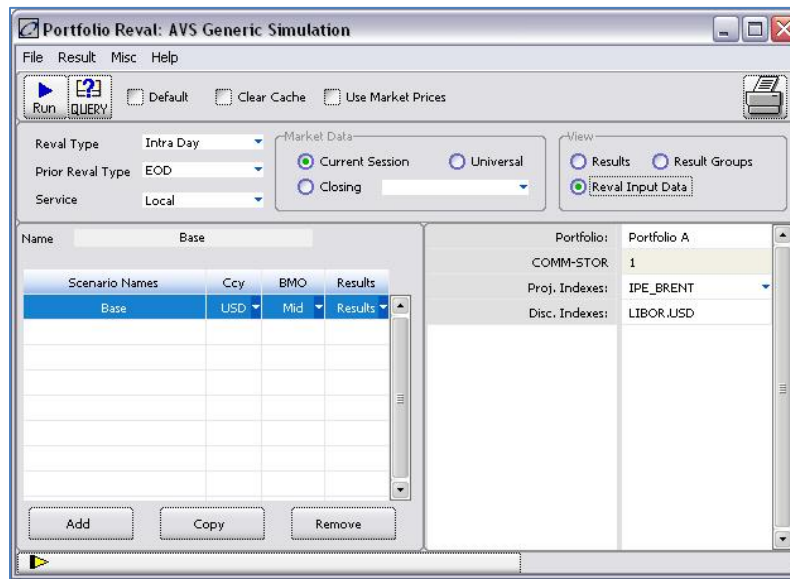

Figure 47. Portfolio Reval Window

Note: A simulation can be run on more than one trade at a time by selecting multiple trades in the Trade Listing Panel.

To run an existing simulation:

1. Select **Load** from the *File* menu.

A pick list of available simulations definitions displays (Figure 48).

2. Highlight the definition to load.

The definition is loaded on screen.

3. Click the Run button .

The simulation is run. The results of the simulation display within the *Simulation Results* window (Figure 49):

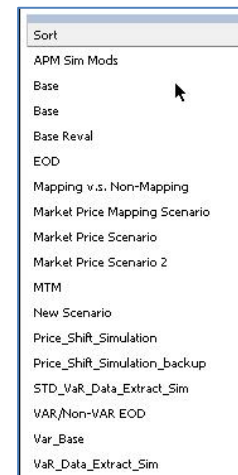

Figure 48. Existing Simulations

Scenario ID	Scenario Name	Deal Num	Ins Num	Instrument Type	Disc Index	Proj Index	Param Seq Num	Param Currency	MTM	Tran Num
1	Base	32854	22520	COMM-STOR	LIBOR.USD	IPE_BRENT	0	USD	0.00	32854
1	Base	32854	22520	COMM-STOR	LIBOR.USD	IPE_BRENT	1	USD	0.00	32854
1	Base	32854	22520	COMM-STOR	LIBOR.USD	IPE_BRENT	2	USD	0.00	32854

Figure 49. Simulation Results

To create a new simulation definition:

1. Use the fields of the *Portfolio Reval* window to structure the simulation as desired.

Refer to the *Online Help User Guide* for full definitions of the *Portfolio Reval* and *Simulation Results* windows.

2. Select **Save As** from the *File* menu.

A permissions window appears (Figure 50).

SimDef Save-As Window

Name: Version:

Directory:

Full Path:

Permissions:

Owner: administrator	☒ Read	☒ Write	☒ Execute
Security Group: None	☒ Read	☐ Write	☒ Execute
Public Permissions:	☒ Read	☐ Write	☐ Execute

Figure 50. Simulation Definition Permissions

This window is used to enter the name of the new simulation, its directory information, and its read/write permissions.

3. Complete the permissions as necessary and click **Save**.

The new simulation definition will be created and appear in the pick list of available simulations.

To edit an existing simulation:

1. Select **Load** from the *File* menu of the *Portfolio Reval* window.

A pick list of available simulations definitions displays (Figure 48).

2. Highlight the definition to load.

The definition is loaded on screen.

3. Edit the parameters of the simulation.

Modify the fields of the window as applicable to change the simulation.

4. Select **Save** from the *File*.

The changes made will be applied to the existing simulation definition.

3.10.2 Running Named Simulations

Users can run simulations on trades directly by bypassing the *Portfolio Reval* window and selecting the desired simulation directly from a pick list. To do so:

1. In the Trade Listing, select the trade(s) for the simulation.
2. Click the **Run Named Simulation** button at the top of the Trade Listing Panel.

The *Choose Simulation/Task* window appears:

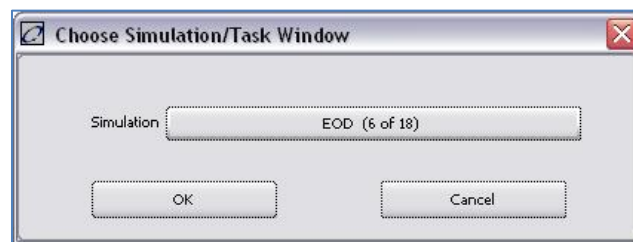

Figure 51. Choose the Simulation to Run

3. Click the **Simulation** button to choose the simulation to run.

A pick list of available simulation definitions appears. Highlight the desired simulation from the list. The **Simulation** button will change to display the name of the chosen simulation.

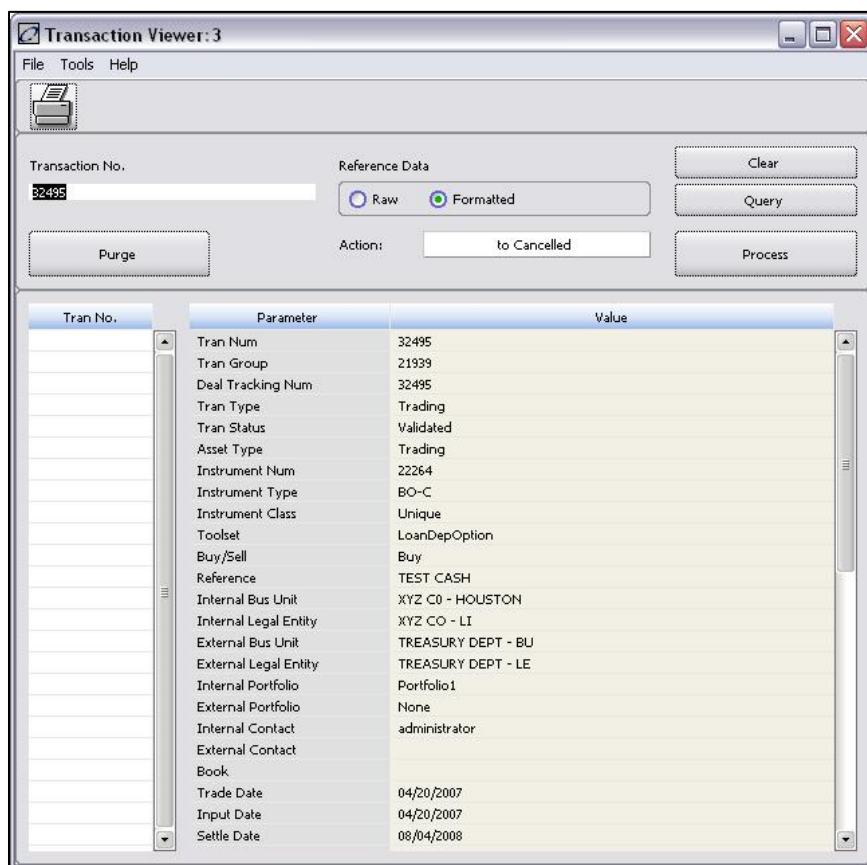

4. Click **OK** to run the simulation.

The results of the simulation appear in the *Simulation Results* window (Figure 49).

3.11 Transaction Viewer

The Trading Explorer Desktop offers an easy-to-access window that allows users to view basic information about a transaction. This information includes all of the data in the fields of the trade's input screen.

To access this viewer window, highlight and right-click on a trade in the Trade Listing Panel, then select **Tran Viewer** from the menu. The Transaction Viewer appears (Figure 52).

The screenshot shows the 'Transaction Viewer: 3' window. At the top, there's a menu bar with 'File', 'Tools', and 'Help'. Below it is a toolbar with a printer icon. The main area is divided into several sections. On the left, there's a 'Transaction No.' field containing '32495' and a 'Purge' button. To the right of this is a 'Reference Data' section with radio buttons for 'Raw' and 'Formatted' (selected), and a 'Clear' button. Below the 'Reference Data' is an 'Action:' field with a dropdown menu showing 'to Cancelled' and a 'Process' button. The bottom section is a table with three columns: 'Tran No.', 'Parameter', and 'Value'. The table contains the following data:

Tran No.	Parameter	Value
	Tran Num	32495
	Tran Group	21939
	Deal Tracking Num	32495
	Tran Type	Trading
	Tran Status	Validated
	Asset Type	Trading
	Instrument Num	22264
	Instrument Type	BO-C
	Instrument Class	Unique
	Toolset	LoanDepOption
	Buy/Sell	Buy
	Reference	TEST CASH
	Internal Bus Unit	XYZ CO - HOUSTON
	Internal Legal Entity	XYZ CO - LI
	External Bus Unit	TREASURY DEPT - BU
	External Legal Entity	TREASURY DEPT - LE
	Internal Portfolio	Portfolio1
	External Portfolio	None
	Internal Contact	administrator
	External Contact	
	Book	
	Trade Date	04/20/2007
	Input Date	04/20/2007
	Settle Date	08/04/2008

Figure 52. Transaction Viewer

The bottom panel of the viewer displays the field data of the trade. The top portion of the viewer contains commands for working with the trade. These commands allow users to view *raw* database data or *formatted* data, as well as **Clear** the data from the window, **Process** the displayed transaction, or **Purge** the transaction from the database.

The **Query** button is used to query for other transactions for viewing. Once the query is executed, the *Tran No.* panel on the right side of the screen populates with transaction numbers. Selecting a transaction number in this area causes the rest of the Transaction Viewer to display the data for the transaction.

Refer to the *Online Help User Guide* for a full description of the fields and functions of the Transaction Viewer.

Note: Additional options for viewing information about trades are available from the View menu. These options are described in section 4.0 of this guide.

4.0 VIEWING TRADE DATA

The **View** menu at the top of the desktop offers a variety of options for viewing specific areas of trade data, as shown in Figure 53. These options vary somewhat depending on the type of trade selected. For example, the **Bond Pricing** option appears for bond transactions, but does not appear for commodity trades.

Most options on the **View** menu call up a specific window of information. For example, selecting **Deal History** displays a window with the complete history of the selected deal.

Please refer to the *Online Help User Guide* for a complete definition of the windows in the **View** menu and their respective fields.

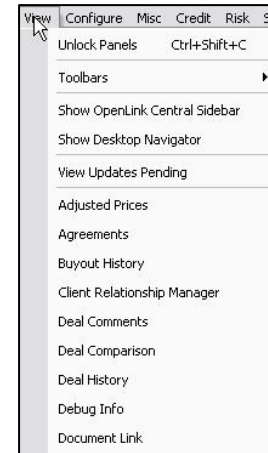

Figure 53. View Menu Options

4.1 Deal Comments

Comments can be added to a deal beyond just the fields available from the instrument input window. These comments are “free style” text and can be anything deemed helpful by the user. Comments can be specified to a particular production month.

To view/enter deal comments:

1. Select **Deal Comments** from the **View** menu.

The Deal Comments window appears (Figure 54):

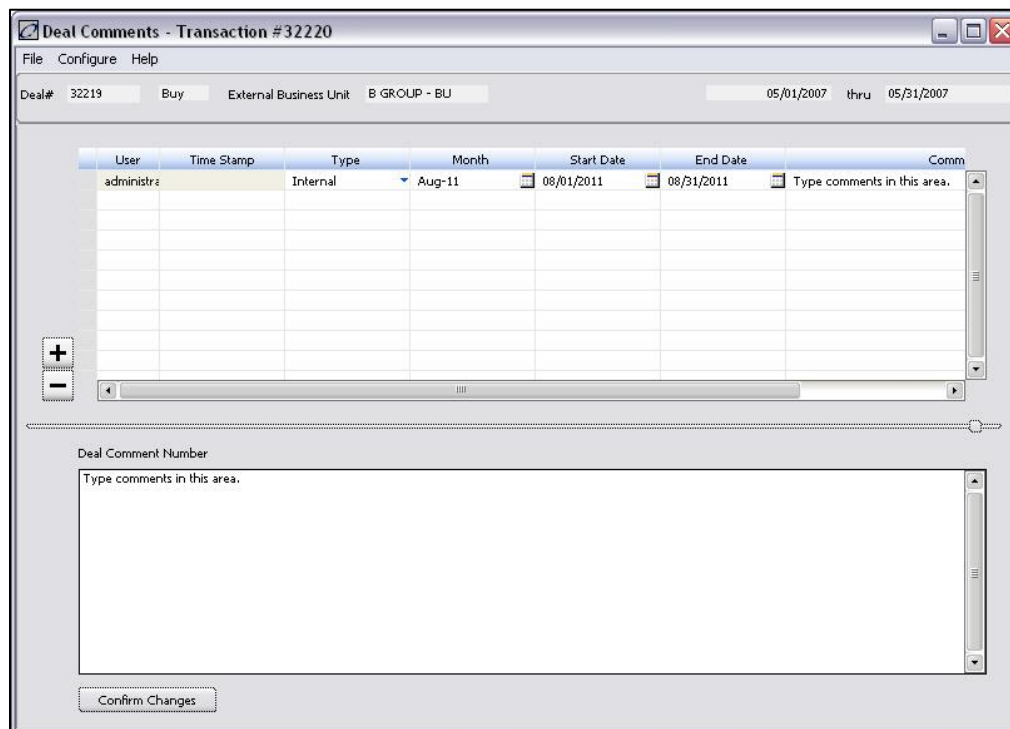

Figure 54. Deal Comments

2. Enter/modify comments for the deal as desired.

Comment data appears in the top panel of the window. The bottom panel is the editor where comments are created and edited. Use the Plus and Minus buttons to add and delete comments.

Refer to the *Online Help User Guide* for a full description of this window and its fields.

3. Click **Confirm Changes** when done.

4.2 Agreements

Users can view all agreements and provisions that will be used in the applicable deal. To do so, select **Agreements** from the *View* menu. Alternatively, click the **Agreements** button at the top of the Trade Editor Panel. The Agreement/Provision Listing window appears (Figure 55).

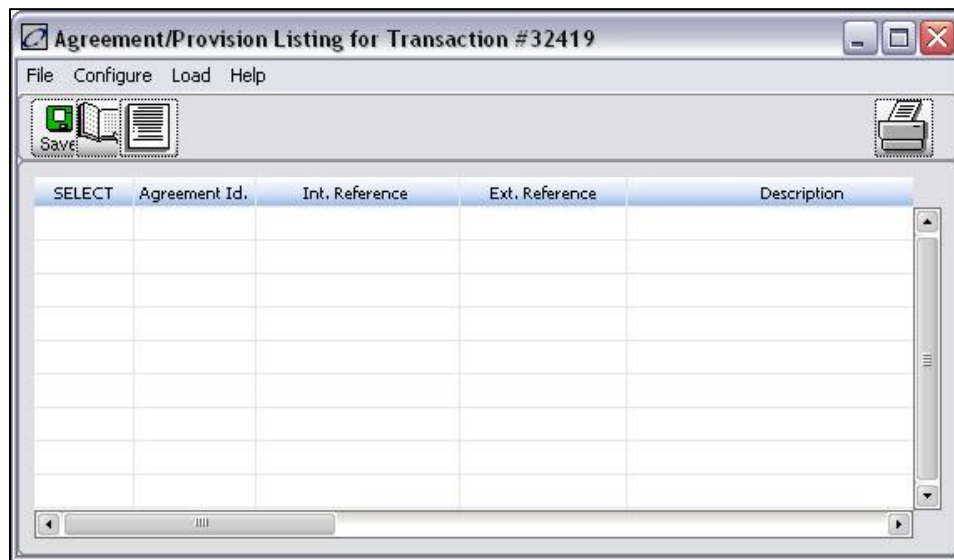

Figure 55. Deal Agreements and Provisions

Refer to the *Online Help User Guide* for a full description of this window and its fields.

4.3 Viewing Events

The Events window allows users to view all transaction events. Transaction events record the operational activity of a deal. This includes confirmable activities such as Rate Reset and Open events as well as delivery events including Cash, Commodities, and Securities. The events can be viewed as a “flattened” out version of the complex deal structure. The primary use of transaction events is to trigger middle and back office activity.

To view events for a transaction, highlight the transaction and select **Events** from the *View* menu. Alternatively, click the **View Events** button at the top of the Trade Listing Panel. The Events window appears (Figure 56).

Event Type	Internal Status	Internal Contact	Event Date	Assoc. Tran Num	Px-Rate	Position	Action Date	External Status	External
Rate Reset	Unknown	administrator	10/06/2003	32419	0.000000	0.00	03/09/2009	Unknown	
Rate Reset	Unknown	administrator	10/08/2003	32419	0.000000	0.00	03/09/2009	Unknown	
Cash Settlement	Known	administrator	10/10/2003	32419	0.000000	9,722.22	03/09/2009	Known	
Cash Settlement	Unknown	administrator	10/10/2003	32419	0.000000	0.00	03/09/2009	Unknown	
Rate Reset	Unknown	administrator	04/08/2004	32419	0.000000	0.00	03/09/2009	Unknown	
Cash Settlement	Known	administrator	04/12/2004	32419	0.000000	899,305.56	03/09/2009	Known	
Cash Settlement	Unknown	administrator	04/12/2004	32419	0.000000	0.00	03/09/2009	Unknown	
Rate Reset	Unknown	administrator	10/07/2004	32419	0.000000	0.00	03/09/2009	Unknown	
Cash Settlement	Known	administrator	10/11/2004	32419	0.000000	884,722.22	03/09/2009	Known	
Cash Settlement	Unknown	administrator	10/11/2004	32419	0.000000	0.00	03/09/2009	Unknown

Tran Status: Validated Internal Party: DJB_INT - BU External Party: OLBANK - BU All Events View

Figure 56. Event Listing for a Transaction

From here the user can modify the types of events shown, and view and edit settlement instructions and account balances. Refer to the *Online Help User Guide* for a full description of this window and its fields.

4.4 Deal History

The Deal History function allows users to view every transaction involved with a deal. Users can also run tasks and scripts from this window, run reports on deals, and perform comparisons between individual transactions of the deal.

To view a deal history, highlight the deal and then select **Deal History** from the View menu or click the **Deal History** button at the top of the Trade Listing Panel. The Deal History window appears as shown in Figure 57:

Tran No.	Tran Status	Version	User	Update Type	Date/Time	Saved Snapshot
> 32419	Validated	1	administrator	Transaction Insert/Update	03/30/2009 05:16:13 PM	✓

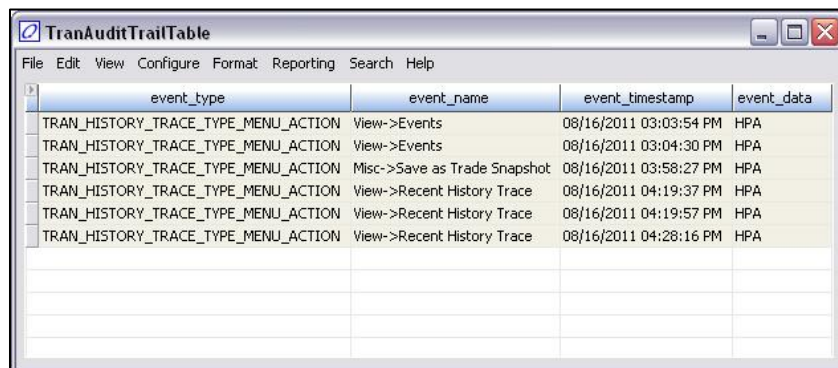

Buttons: Deal Comparison, History Trace

Figure 57. Deal History Window

Double-clicking on a row in the window brings up the transaction input window for that particular transaction. To perform a comparison, highlight two rows in the window and click the **Deal Comparison** button. The **History Trace** button displays information about the actions taken by a user to book or amend transactions between versions.

Note: In order for History Trace to function, it must first be enabled using the AB_TRAN_HISTORY_TRACE environment variable. Otherwise, history trace data will not be collected for viewing.

The recent history of a deal can also be viewed by selecting **Recent History Trace** from the View menu (Figure 58):

event_type	event_name	event_timestamp	event_data
TRAN_HISTORY_TRACE_TYPE_MENU_ACTION	View->Events	08/16/2011 03:03:54 PM	HPA
TRAN_HISTORY_TRACE_TYPE_MENU_ACTION	View->Events	08/16/2011 03:04:30 PM	HPA
TRAN_HISTORY_TRACE_TYPE_MENU_ACTION	Misc->Save as Trade Snapshot	08/16/2011 03:58:27 PM	HPA
TRAN_HISTORY_TRACE_TYPE_MENU_ACTION	View->Recent History Trace	08/16/2011 04:19:37 PM	HPA
TRAN_HISTORY_TRACE_TYPE_MENU_ACTION	View->Recent History Trace	08/16/2011 04:19:57 PM	HPA
TRAN_HISTORY_TRACE_TYPE_MENU_ACTION	View->Recent History Trace	08/16/2011 04:28:16 PM	HPA

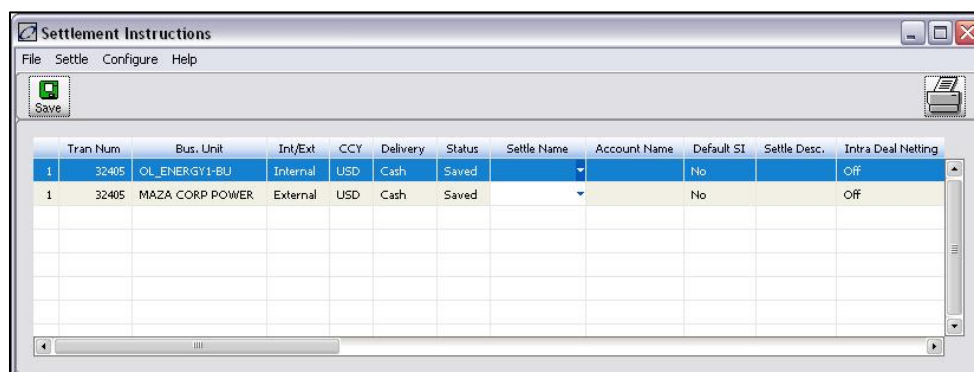

Figure 58. Recent History Trace

Refer to the *Online Help User Guide* for a full description of the Deal History and Recent History windows and their fields.

4.5 Settlement Instructions

The Trading Explorer Desktop allows users to view and modify settlement instructions for a particular deal. New accounts and settlements instructions can be created as well.

To view settlement instructions, highlight the applicable deal and select **Settlement Instructions** from the View menu, or click the Settlement Instructions button  from the top of the Trade Listing Panel. The *Settlement Instructions* window appears as shown in Figure 59:

Tran Num	Bus. Unit	Int/Ext	CCY	Delivery	Status	Settle Name	Account Name	Default SI	Settle Desc.	Intra Deal Netting
1	32405	OL_ENERGY1-BU	Internal	USD	Cash	Saved		No		Off
1	32405	MAZA CORP POWER	External	USD	Cash	Saved		No		Off

Figure 59. Settlement Instructions Window

The options in the *Settle* menu are used to modify and create settlement instructions. To edit a settlement instruction, highlight the applicable row in the window, and then select **Edit** from the *Settle* menu.

Refer to the *Online Help User Guide* for a full description of this window and its fields.

4.6 Client Relationship Manager

The Client Relationship Manager allows users to view and manipulate data specific to the counter-party of a deal, including business unit and legal entity information. The Manager allows users to drill-down to view information about a party's address, credit rating, delivery codes, and so forth.

To access the Client Relationship Manager, highlight the applicable deal and select **Client Relationship Manager** from the View menu. The Manager appears, as shown in Figure 60:

Figure 60. Credit Relationship Manager

Use the tabs at the top of the window to view **Party Details** and **Party Trade Details**. New tabs can also be added to the window to create custom configurations. Use the **View Business Unit List** and **View Legal Entity List** checkboxes to select the type of data to display.

Refer to the *Online Help User Guide* for a full description of the Credit Relationship Manager and its fields.

4.7 Linking Documents to Trades

The *Document Link* window allows users to link documents to a deal. Users can link documents either by selecting the path and saving the link or by saving the actual document into the database. The linked documents are listed in the window and can be opened from the window directly. The window also allows users to define and run a task that automatically links documents to deals.

To link documents to a deal:

1. Click on the applicable deal, and then select **Document Link** from the *View* menu.

The Document Link window appears (Figure 61):

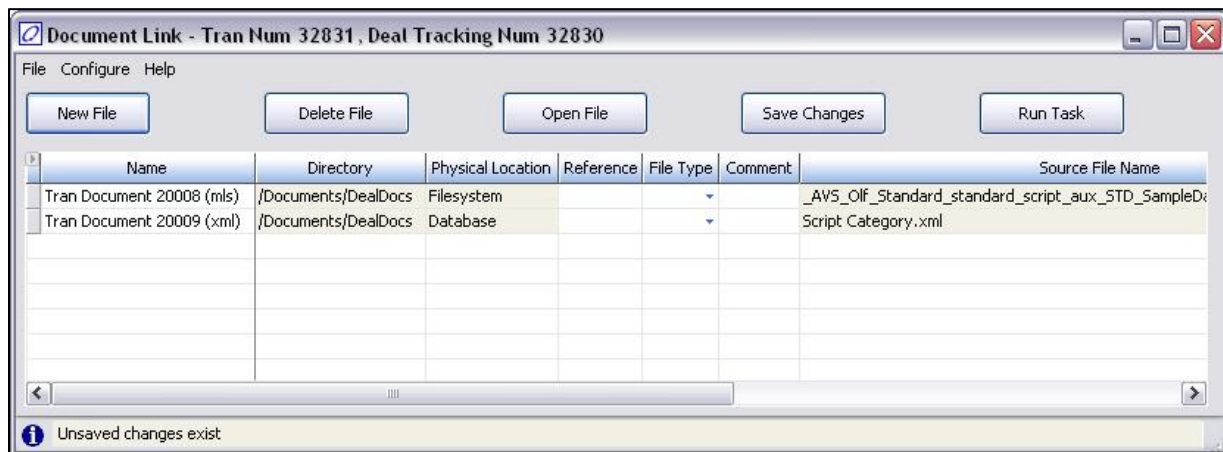

Figure 61. Document Link Window

The bottom panel of the window lists the documents linked to the deal. The *Physical Location* column states where the document resides. In the example above, one document is linked from the file system, while the other has been imported directly into the database.

To open a document, select it from the list and click the **Open File** button or simply double-click the document within the list.

2. To add a document, click the **New File** button.

A menu of options appears listing the ways documents can be added (Figure 62). Select the applicable method from the list, then select the document to be added from the directory window that appears.

Figure 62. New File Menu

3. To run a task (i.e., script), select **Task Button** from the *Configure* menu, then choose a task to associate with the **Run Task** button. Click the button to run the task.

Tasks can be run to automatically link documents to deals.

4. Click **Save Changes** to save the documents to the deal.

4.8 Symbolic Dates

All symbolic dates for a trade can be quickly viewed by accessing the Symbolic Dates window. To do so, highlight the applicable deal and then select **Symbolic Dates** from the View menu. An example of the window is shown in Figure 63:

	Side 1	Side 2	Side 3
Settle Date	2d	2d	2d
Start Date	Dec-10	Dec-10	Dec-10
Maturity Date	Dec-10	31-Jan-11	31-Jan-11
Froll Date			
Broil Date			
Upfront CFLOW Date			
Backend CFLOW Date			
Floating Strike Date			

Figure 63. Symbolic Dates Window

The symbolic dates for all sides of the deal are displayed. Symbolic dates cannot be modified from here.

4.9 Viewing Recent Trades

Recently created trades appear in the *Recent Trades* folder. The Recent Trades folder appears just below the *Trades* folder in the Navigation Panel, as shown in Figure 64. If a Recent Trades folder does not exist, one will be created.

Figure 64. New Trade Data Object

After entering data in the Trade Editor Panel for the new transaction and then validating it, the Navigation Panel and the Trade Listing Panel update automatically to indicate the new information (Figure 65).

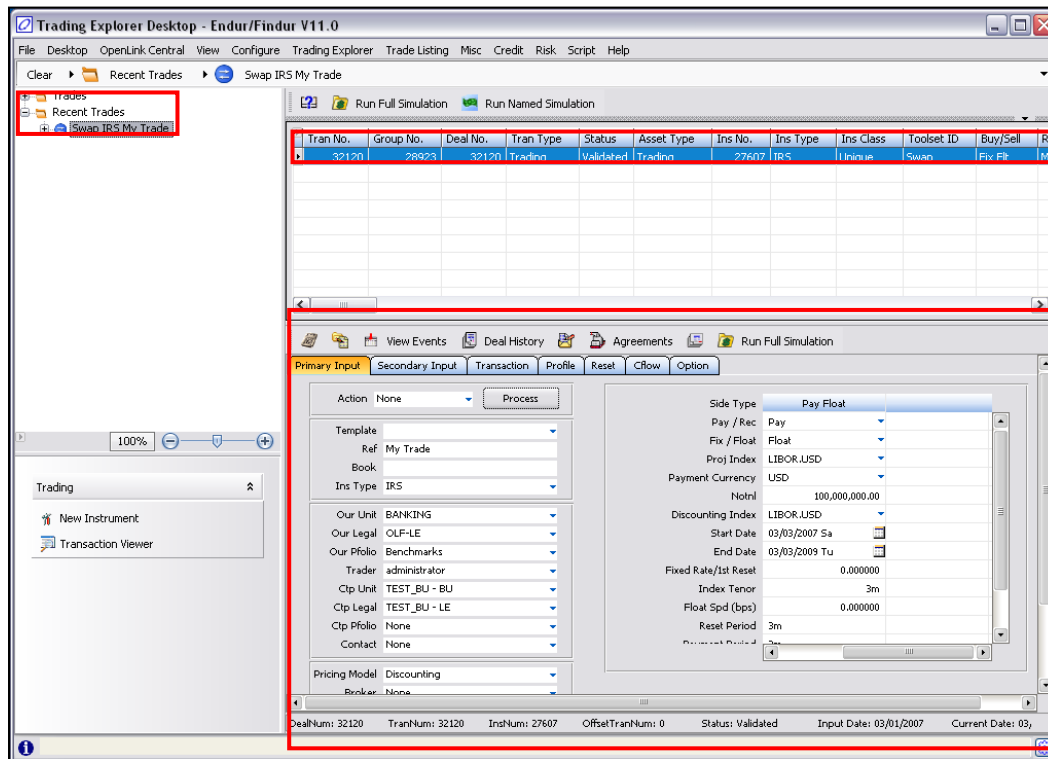

Figure 65. New Trade with Content

The new trade remains in the Recent Trades folder until either:

- Trading Explorer Desktop is closed and opened again (the newly created trade then appears under the Trades folder) or
- The configuration settings for the Recent Trades folder are changed. Right-click on the Recent Trades folder and select **Recent Trade Settings** (Figure 66).

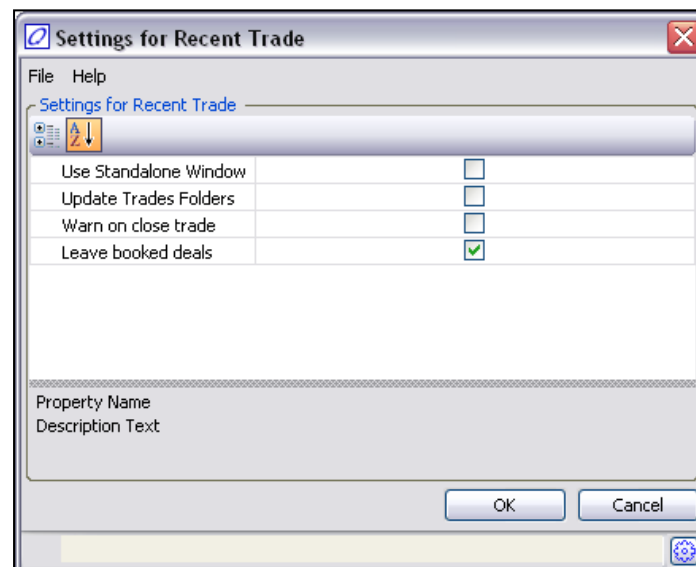

Figure 66. Recent Trade Settings

The following options are available within Recent Trade Settings:

Recent Trade Settings	Description
Use Standalone Window	Opens new trades in a separate trade input screen instead of within the <i>Trade Editor</i> panel.
Update Trades Folders	Updates the Trades folder to include newly booked deals.
Warn on close trade	Presents a warning when you navigate away from a deal that has not been booked. This occurs when selecting a new trade within the <i>Navigation</i> or <i>Trade Listing</i> panels or when closing a standalone trade input screen.
Leave booked deals	Leaves booked deals in the Recent Trades folder after a refresh.

4.10 Pricing Data

The *View* menu contains three options for viewing pricing data for individual deals, depending on the type of deal/instrument selected—**Pricing Details**, **Prices**, and **Pricer**. All three options are discussed in this section.

4.10.1 Pricing Details

The Pricing Details function details the basic, up-to-date pricing data for a deal, including such things as the currency, notional, payments, and payment dates.

To access this function, select **Pricing Details** from the *View* menu. The Pricing Details window appears:

Toolset	Instrument	Model	Param SeqNum	Seq Num	Source	Flow Type	Notional	Price/Rate	DCF/Not. Ratio	Currency	Price/Unit Conversion	Payment Date
Power	PWR-PHYS	Discounting Cash	0	0	PROFILE	None	0.00	0.000000	1.000000	USD	1.000000	10/25/21
Power	PWR-PHYS	Discounting Cash	1	0	PROFILE	None	0.00	0.000000	1.000000	USD	1.000000	10/25/21
Power	PWR-PHYS	Discounting Cash	1	0	CFLOW	Premium	0.00	0.000000	0.000000	USD	1.000000	10/25/21

Figure 67. Pricing Details

The fields of this window vary according to the type of instrument/trade selected. The example above (Figure 67) shows the Pricing Details window for a power deal.

Pricing data in this window can be exported to a text or xml file, or used in conjunction with scripts or Crystal Reports. Users can also search for particular strings of data using the **Find** option in the *Search* menu function. The presentation of the data can also be modified using the options in the *Format* menu.

4.10.2 Prices

The Prices function is used with commodity deals to set-up tiered volume pricing.

To access this function, choose a commodity deal and then select **Prices** from the View menu. The *Commodity Pricing* window appears (Figure 68).

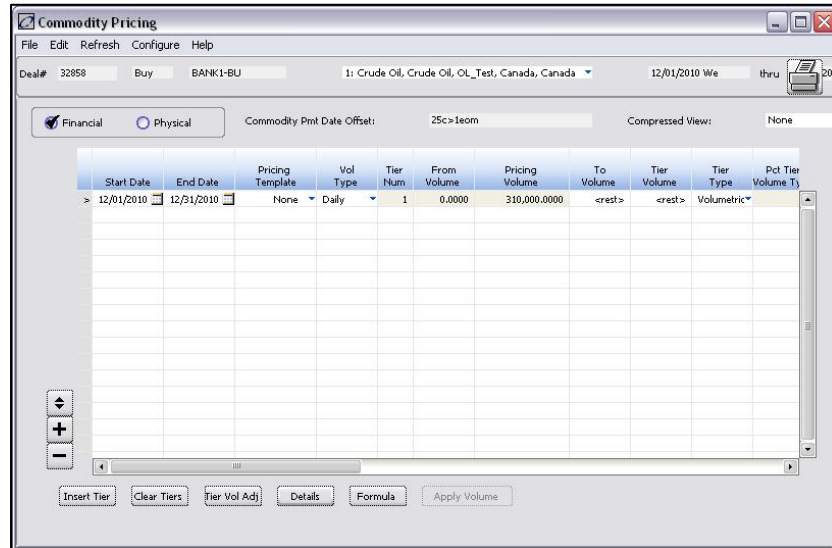

Figure 68. Commodity Pricing Window

The window allows users to toggle between the financial and physical aspects of a deal, add and delete pricing tiers, reset tiers, and so forth.

Refer to the *Online Help User Guide* for a full description of the *Commodity Pricing* Window.

4.10.3 Pricer Window

Pricing data for individual deals can be viewed using the Pricer window. The Pricer window allows users to calculate the theoretical price or market value of an instrument or deal given a rate and an index. The fields and function of the Pricer window vary according to the type of instrument. Figure 69 shows an example of a Pricer window for an interest swap trade:

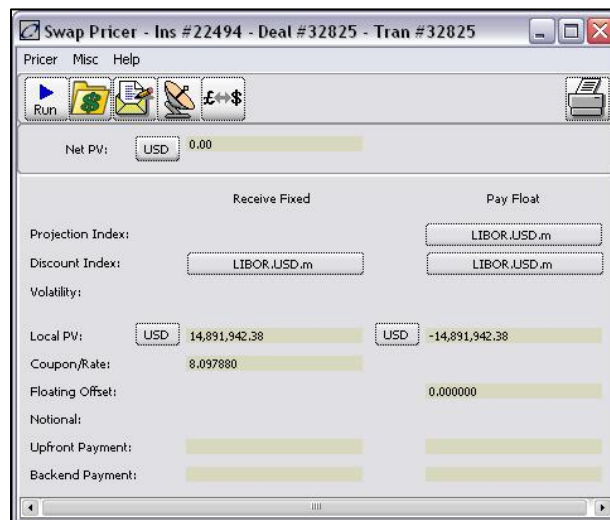

Figure 69. Interest Swap Pricer

To access the Pricer window, highlight the applicable trade and then select Pricer from the View menu or click the Pricer button  at the top of the Trade Listing Panel. For a full description of the various Pricer windows, refer to the *Online Help User Guide*.

4.11 Novation History

Novation processing offers parties to the various Master Agreements published by ISDA an efficient means to agree to a uniform process by which consents to transfer of interests in Credit Derivative Transactions may be obtained.

To view the historical novations for a deal, select **Novation History** from the View menu. The Novation History window displays. Data in this window can be exported to a text or xml file, or used in conjunction with scripts, Crystal Reports, or MS Excel. Users can also search for particular strings of data using **Find** option in the *Search* menu function. The presentation of the data can also be modified using the options in the *Format* menu.

4.12 Buyout History

To view the historical buyouts for a deal, select **Novation History** from the View menu. The Buyout History window displays. Data in this window can be exported to a text or xml file, or used in conjunction with scripts, Crystal Reports, or MS Excel. Users can also search for particular strings of data using the **Find** option in the *Search* menu function. The presentation of the data can also be modified using the options in the *Format* menu.

4.13 Formulas

The View menu contains two options for viewing and modifying formula data for individual deals—**Payment Formula** and **Wrapper Formula**. Both options are discussed in this section.

4.13.1 Payment Formula

Payment formulas allow custom code to be executed during the calculations for an instrument's profile table. They let users redefine the profile payment amount with a defined formula. The values of other fields in the Profile, Reset, or Operation tables can also be changed.

Custom deal payment formulas are added, tested, and maintained through the Formula window. Payment formulas are defined at the instrument level for both shareable and unique instruments.

To access this function, select **Payment Formula** from the View menu. The Formula window appears.

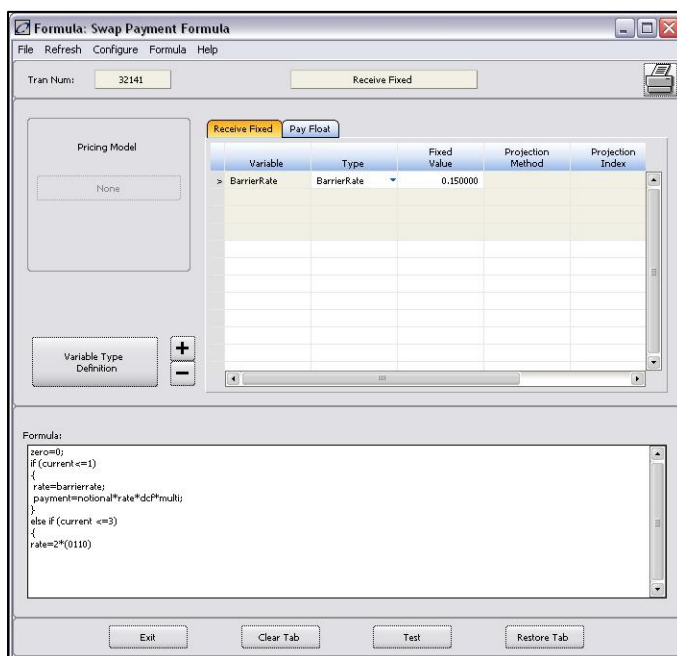

Figure 70. Formula Window for Swap Trade

The format of the Formula window varies according to the type of trade instrument selected. The example above (Figure 70) shows the window for an interest rate swap transaction. The window may also contain numerous tabs depending on the number of legs or sides of the deal. Payment formulas may be entered for each tab, such as each leg/side of the deal.

Refer to the *Online Help User Guide* for a full explanation of this window and its fields.

4.13.2 Wrapper Formula

Wrapper formulas are pricing formulas that override the default system pricing formulas. To access this function, select **Wrapper Formula** from the View menu. The Wrapper Formula window appears (Figure 71):

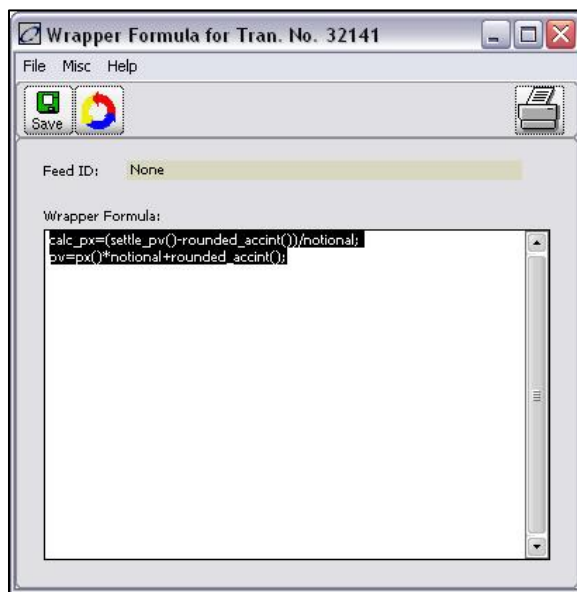

Figure 71. Wrapper Formula Window

Wrapper formulas are used to calculate the present value (PV) of a deal. By default, the PV of a deal is returned by a formula determined by the pricing model of the deal. Use of a wrapper formula allows the default calculation to be overridden.

Typically, wrapper formulas are used only on bonds and futures instruments. For example, on bonds, the default wrapper formula is:

$$\begin{aligned} \text{calc_px} &= (\text{settle_pv}() - \text{accint}()) / \text{notional}; \\ \text{pv} &= \text{px}() * \text{notional} + \text{accint}(); \end{aligned}$$

This formula computes the value of a bond deal by adding the bond price (as calculated by the "px() function) to any accrued interest (as calculated by the "accint() function) and putting the result into the "pv" variable. Note that the calc_px part of+ the wrapper formula has no effect on the PV of the deal; it is a separate variable used for the Calc Price result.

It is rarely necessary to modify wrapper formulas, and extreme care should be taken when doing so as the formulas determine the value of deals.

Refer to the *Online Help User Guide* for a full explanation of the fields and functions of the Wrapper Formula window.

4.14 Fees

Fees can be associated with trades by selecting **Fees** from the *View* menu. Users can select the type of fee to assign to a trade, and define parameters for it such as amount, pay period, and offsets.

The type of window that appears for this function depends upon the type of instrument used in the transaction. For example, the Fees window for a power transaction is shown in Figure 72:

Fee Type	Pay Rec	Pay Period	Payment Date Offset	Accounting Date Offset	Fee	Calc Type	Calc Volume	Calc Unit	Calc Period
Agent	Pay	1m	25c>1eom		0.000000	Per Unit	Unscheduled	MWH	

Figure 72. Fee Window for a Power Deal

For a full description of each type of Fee window, refer to the *Online Help User Guide*.

4.15 Prior Period Adjustment (PPA) History

It is common practice for transaction quantities (price, rate, and fee) to be revised after initial invoicing processes have occurred. When this happens, the OpenLink system computes the value of any adjustment and enables users to settle with their counterparties.

The Trading Explorer Desktop allows users to view the complete history of prior period adjustments. To do so, select the applicable deal and then choose **PPA History** from the *View*

menu. The PPA History window appears. For a complete description of this window, refer to the *Online Help User Guide*.

4.16 Viewing Volume Data

The Trading Explorer Desktop offers various options for viewing the volume data for commodity deals. These options are available under the *View* menu and are explained below.

4.16.1 Volumes

Trading volumes represent the deal's intent to receive and/or deliver volumes. The volume that is entered into a deal is referred to as the trading volume. This deal and its volumes are then communicated to the scheduling group to be scheduled on the pipeline for the actual movement of the gas.

To view and modify volume data, select **Volumes** from the *View* menu. The Volumes window appears, as shown in Figure 73.

Deal Num	Unit	32858		
Pipe	BBL			
Subgroup	OL_Test			
Zone	Crude Oil			
Vpool	Canada			
Location	XYZ_VAL POOL			
Meter	Canada			
	1A

Quantity Details Define Constraints Notify Notify Time 00:00

F4 = Copy Volume Thru 99/99/9999 Date

Figure 73. Volumes Window

Trading Volumes can be entered via two methods:

1. First-of-Month Elections – The Trader typically specifies the FOM Elect volume during “Bid Week.” This is prior to the next Cash Month (Spot Trading Month) when the actual commodity flow occurs. This method is used when the deal typically has minimum

and/or maximum limits to which the customer can elect for a month to take prior to the deal's flow.

2. Daily Trading Volumes – This method is the actual keying of each day's trading volumes.

The Volumes window provides options for six views:

- Monthly Elections (DQ)—Daily equivalent based on FOM Election
- Monthly Election (MQ)—Monthly equivalent based on FOM Election
- Daily Volumes—Daily trading volumes. These initially default to the Monthly Election (DQ) for each day of the trade
- Daily w/ Swing Counts—This field can only be modified after the Constraints have been set up via the Define Constraints button on the Volumes window
- Monthly Volumes—Monthly trading volumes aggregated from each month's Daily Volumes
- Monthly Fuel Percent—Per month adjustment (manual) of Fuel Percentage. These initially default to the side's Fuel Percent

To change between these views, use the radio buttons in the **View** section of the window. The dates of the volume displayed are controlled using the radio buttons in the Filter section, as well as the **As Of Date** field. Use the options in the Volume section to control the types of volumes displayed.

Double-clicking on a volume listing displays the daily volumes for that time period (unless **Daily Volumes** is already displayed). Double-clicking on a daily volume listing brings up a window display that listing's actual interim volume.

Users can also view Quantity Details and Define Constraints (for daily volumes) using the applicable buttons at the bottom of the window.

For a full description of the Volumes window, refer to the *Online Help User Guide*.

4.16.2 Daily Volume Calendar

The Daily Volume Calendar displays both daily volume activity and the corresponding pricing details in one window. Although the data displayed in this window can be modified here, some additional information such as constraints and views are not available in this window. This data can be modified in the Volumes window (see section 4.16.1).

To access this function, highlight the applicable commodity deal in the Trade Listing Panel and select **Daily Volume Calendar** from the View menu. The window appears as shown in Figure 74.

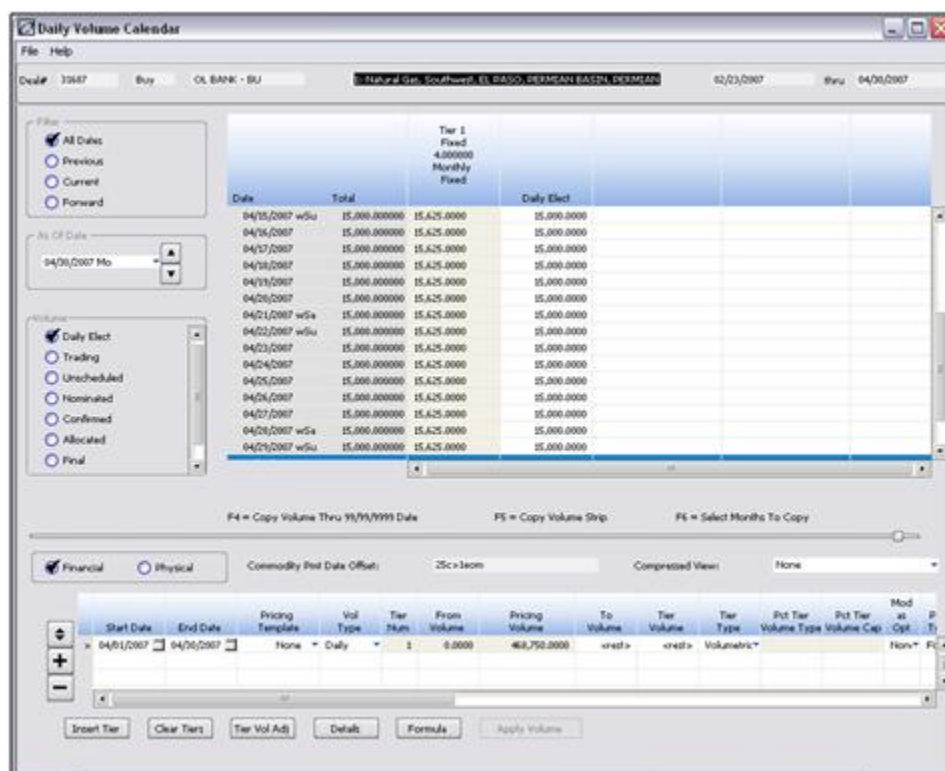

Figure 74. Daily Volume Calendar

To change the view of the calendar, filter the display using the radio buttons and the *As Of Date*. For example, the *Volume* radio buttons allow users to view trading volumes, unscheduled volumes, nominated volumes, and so on. Selected volume types can be edited in the upper panel as well.

The buttons on the lower panel of the window allows users to insert, clear, adjust, and view the details of pricing tiers. Pricing formulas are added from here as well. The Pricing Formula window can be called up by double-clicking on a row in the lower panel.

Refer to the *Online Help User Guide* for a full description of the fields and functions of the Daily Volume Calendar.

4.16.3 Volume Type Usage

The Volume Type Usage function is used to specify the imbalance value type and the start and end date/time for which it is to be used in the Hourly Gas Scheduling window.

To use this function, highlight the applicable commodity trade and select **Volume Type Usage** from the View menu. The *Volume Type Usage* window appears.

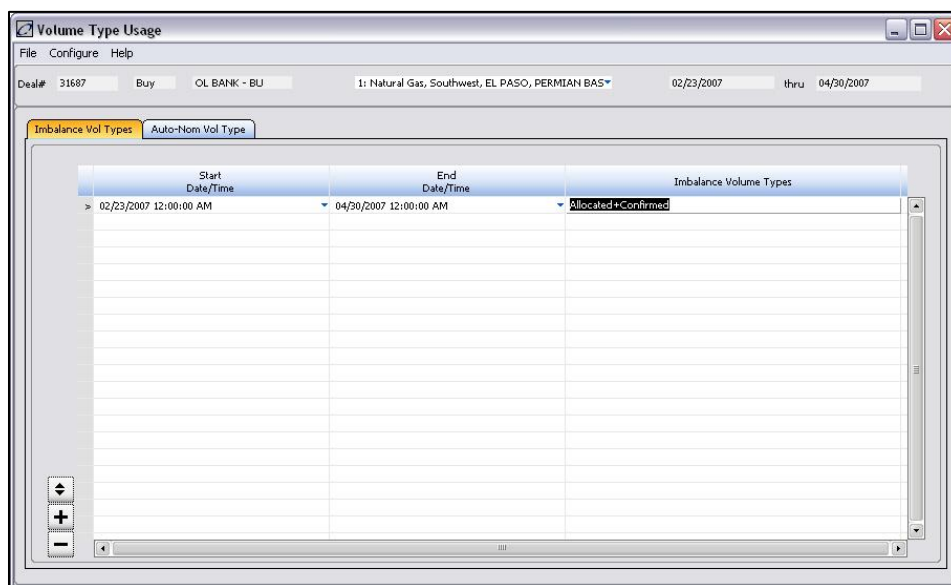

Figure 75. Volume Type Usage Window

The tabs within the window allow users to view/modify **Imbalance** volume types and **Auto-Nom** volume types. The buttons on the left side of the window are used to add, delete, and split dates for the volumes displayed.

4.16.4 Volume Constraints

Users can set constraints on deals. Constraints can be set on the volume of commodities delivered on specific dates, or for the specific locations to which the commodities will be delivered.

To set deal constraints, select **Volume Constraints** from the *View* menu. The Deal/Location Constraints window appears. This window allows constraints to be defined on a deal level or a location level, and to base constraints on daily or first-of-month volumes. A deal can have both deal and location level constraints.

There are two types of constraints:

- **First-of-Month (FOM) Limits**

The owner of this type of swing right has the right to elect a daily volume prior to the beginning of the delivery month. This election is based on some contractual range. This range is referred to as the FOM Minimum Quantity (FOM_Min) and the FOM Maximum Quantity (FOM_Max). The owner of this right has a deadline to meet to send the desired elected volumes.

- **Swing Rights**

The owner of this type of swing right has the right to swing volumes within a date range and per any specified limitations. Limitations can be defined as a certain number of swings that occur within a month. An example of this view is shown in Figure 76.

Figure 76. Deal Constraints—Swing Rights View

For a full description of the fields and functions of the Deal/Location Constraints window, as well as examples of its use, refer to the *Online Help User Guide*.

4.17 Viewing Scheduling Data

The Trading Explorer Desktop offers options for viewing schedule details and schedule locations for commodity deals. These options are available under the *View* menu and are explained below.

4.17.1 Schedule Details

To view schedule details for a commodity deal, select the applicable deal and select **Schedule Details** from the *View* menu. The *Schedule Detail* window appears as shown in Figure 77:

Figure 77. Schedule Detail Window

This window allows users to define information about the physical delivery of a product. Users can also use the buttons at the bottom of the window to view **Specifications** for commodities, **Delivery Events** and **Related Nominations**.

4.17.2 Schedule Locations

To view schedule locations for a commodity deal, highlight the applicable deal and select **Schedule Locations** from the View menu. The Schedule Locations window appears as shown in Figure 78.

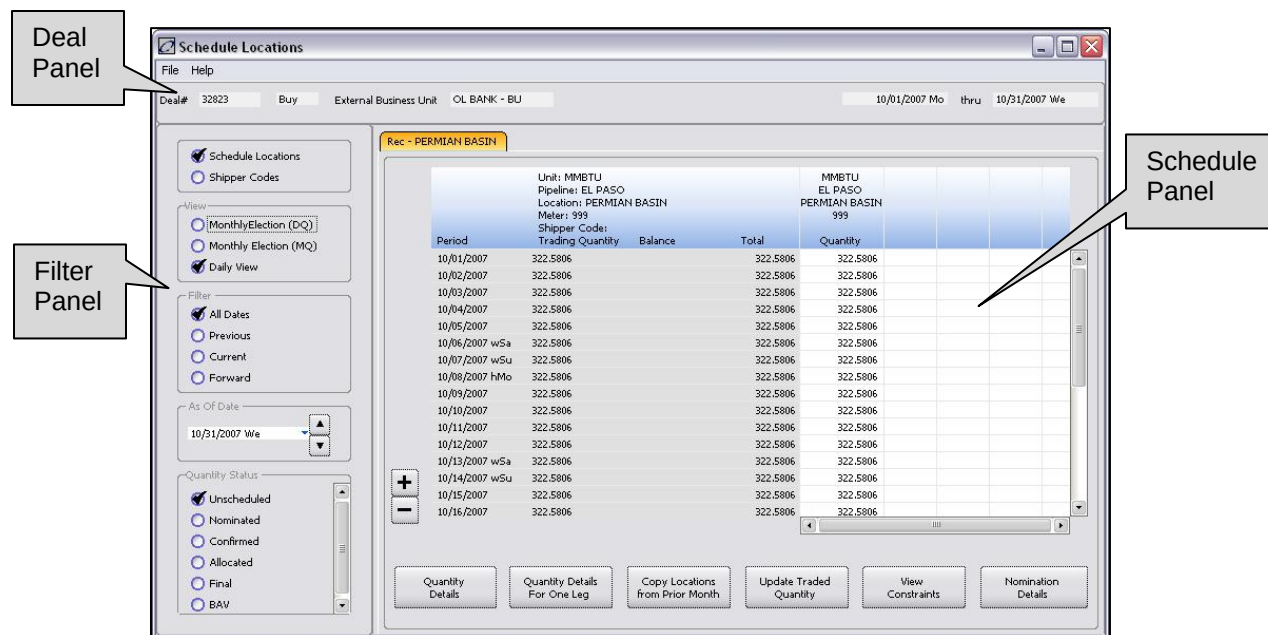

Figure 78. Schedule Locations Window

This window is used to view the schedule locations of the selected commodity transport deal. This screen allows a scheduler to add scheduling locations and adjust/allocate volumes for the selected deal as needed.

The window is comprised of the Deal, Filter, and Schedule panels. The Deal panel contains only summary data of the selected transaction. The Filter panel is used to sort the data displayed in the Schedule panel.

Refer to the *Online Help User Guide* for a full description of the fields and functions of the Schedule Locations window.

4.17.3 Shipper Codes

Shipper codes are unique, three-character symbols assigned to shippers on a balancing zone by the network operator. Movements of commodities into or out of a balancing zone essentially involve shipper code exchanges. Quantities are tracked by shipper code at every step of the communication process. Each individual shipper code quantity is available at every step in the life cycle of the deal.

To view shipper codes for a deal, highlight the deal and then select Shipper Codes from the View menu. The *Shipper Codes* window appears as shown in Figure 79.

The *Shipper Codes* window functions similarly to the Schedule Locations window (see section 4.17.2).

Figure 79. Shipper Codes Window

4.18 Rates

The Trading Explorer Desktop allows for the configuration of a wide variety of natural gas pipeline rate structures, which are used for gas scheduling. To access this function, select transport, storage, storage balance, or transit deal, and then select **Rates** from the View menu. The Rate Definitions window appears as shown in Figure 80.

Figure 80. Rates Definitions Window

The tabs of the window offer different rate types to view, add, delete, or modify. To add an additional row to the definition, click the plus key and add the applicable data in the fields of the window. The Tools menu offers options to **Validate Data** and **Find Rates**.

Note: Before undertaking the configuration process, it is essential to understand all of the details of the contracts that have been executed.

4.19 Taxes

The Taxes function allows users to view trade level tax consequences. Tax data is only generated if tax jurisdiction assignments and tax rates have been defined and if the deal has been processed (either to “New” or “Validated”). This function is only available to the Commodity and Power toolsets.

To access this function, highlight an applicable deal and select **Taxes** from the *View* menu. The Taxes window appears. The window contains detailed tax information such as taxable quantities, effective rates, percentages, and currencies. For a full description of the fields of the Taxes window, refer to the *Online Help User Guide*.
